Chapter 1: User Guide

The Harmony core functionality are explained in this User guide. All the steps required to create and complete a project are covered in the following chapters with concept descriptions and detailed step-by-step procedures focused on the task at hand.

Detailed parameter descriptions for all buttons, commands, and functions are covered in the Reference guide and Preference guide. Some of them are explained here where necessary to the understanding of a given concept or procedure.

Chapter 2: Project Creation

Once Harmony is installed, you are ready to start the application and animate! In this chapter, you will learn about starting the application, creating scenes, setting the resolution and opening the scenes.

About the Database

Harmony can be used in database mode (online) via the server connection (Harmony Server) or as a standalone application (offline).

Several animators can work simultaneously on the same project while the asset library provides users with easy access to up-to-date media assets. Harmony is scalable; more than 100 staging clients can share animation just as easily as a few can.

Harmony Server is the link between the client machines and the server. It lets you work on the different projects stored in the central Harmony database.

At the heart of the Harmony solution is the server, which centralizes all the production assets in a repository. The server is compatible with Windows, Linux or Mac OS X. To learn more, refer to the Control Center Guide.

If you installed the complete version (Harmony Server / Network), when you start Harmony, you can opt to either work offline in the application as a standalone software, or connect to the database to work on projects via the database.

When working with Harmony Server, the scenes and their data are stored directly on the server. No data is saved or stored on the client machine. The client machines access the database and load the scenes and drawings directly from the server. Each time the user saves his scene, the data is updated directly on the server. There are no upload or download operations (check-in, check-out) done between the server and the clients.

NOTE: If you have a standalone license, you will not have access to the database. You will automatically start the application in standalone mode.

About the Database Structure

Harmony Server has a client-server configuration linked through a network. Although the user is working on a client machine, all of the data is saved on the server.

You can compare the Harmony Server structure to a filing cabinet. Every element is structured and follows a strictly organized hierarchy.

The following production structure hierarchy is used:

- **Environment:** Production, project, feature film, series—see [Environment Structure on page 31](#)
- **Job:** Episode and sequence from each environment
- **Scene:** Scene from each job
- **Element:** Layers and columns from each scene
- **Drawing:** Drawings from each element

If you imagine the environment as a filing cabinet containing all the folders and information, then the following structure is used:

- The job is a drawer in the filing cabinet containing all the folders related to the drawer's topic.
- The scenes are the folders contained in that drawer
- The elements are the papers contained in the folder
- The drawings are the information contained on the paper

A Harmony Server scene can only be saved inside the structure. This maintains structural organization so nothing is lost. By adhering to this structure, every user working in the database always knows where to find the scenes to work on.

Environment Structure

Before you create or save any elements in your production, you should decide upon a project name. This should reflect the content or title. Use the name to create the project's environment, where you will store all of your production elements.

For example, the environment could be called `adventure_movie`. An environment can be used for movies, series, commercials, student work database, etc.

For a series, you can create an environment with the same name as the series, such as **smith_family**. Then you can create a job per episode: **smep_001**, **smep_002**, and so on. Here is what the letters and numbers represent:

- **sm**: The first two letters of the name smith
- **ep**: Episode
- **001**: The number of the episode

For commercials, which are rather short, you can create an environment, such as **commercials**. Then you can create one job per commercial: toothpaste, soap, car, and so on. As commercials are short and do not require splitting into episodes or sequences, you can group them all in the same environment.

For a database of student's work, you can create an environment and name it with the class or group name, such as **gr402a**. Then you can create one job per student: **smith_john**, **robertson_jane**. And then store the different student exercises in separate scenes under their job name.

Starting Harmony

T-HFND-001-002

You can run Harmony on Linux, Mac OS X or Windows operating systems.

NOTE: On Mac OS X 10.10.5 and more recent versions, Harmony and its modules will not start the first time if your security is set to **Mac App Store and Identified Developers**. Change your security to **Anywhere** or right-click on Harmony or its modules to open it for the first time only.

How to start Harmony

1. Do one of the following:
 - **Windows:** Start > Programs > Harmony 14.0 Advanced > Harmony Advanced
 - **Mac OS X:** Applications > Toon Boom Harmony 14.0 Advanced > Harmony Advanced
 - **Linux:** /usr/local/ToonBoomAnimation/harmonyAdvanced_14.0/Inx86_64/bin/HarmonyAdvanced

Toon Boom Harmony opens. If you have the complete version installed, the login dialog box opens.

NOTE: If you have a standalone license, Toon Boom Harmony will open directly with the Welcome screen.

2. To connect to the database, in the User Name field, enter your username. It is generally provided by the supervisor, system administrator or team lead.
3. Select the **Connect to Database** or **Work Offline** option.
 - **Connect to Database:** (Your database must first be set up.) Lets you work on Harmony connected to the database so you can access scenes stored in the central database of the Toon Boom Server; certain options become available in the different menus. However, you will not be able to create new scenes directly from Harmony Advanced and the available scenes will be the ones that were previously created using the Control Center.
 - **Work Offline:** Enabled by default when you start Harmony for the first time. Using this mode lets you create new scenes and work locally on your machine on independent projects as you would with any local software. However, the following limitations apply:
 - Options exclusive to Harmony Server will not be available in the different menus.

- You will not have access to any projects stored in the central database of the Toon Boom Server.

4. Click **OK**.

In Offline mode, the Welcome Screen opens—see [About the Welcome Screen](#) on page 40.

In Database mode, the Database Selector opens—see [Connecting to the Database](#) on page 35.

Connecting to the Database

Before you can work in Harmony via Harmony Server, you must be connected to the Harmony database. When you connect to the database, you cannot create new scenes directly from Harmony Advanced. The available scenes will be the ones that were previously created using the Control Center module.

How to connect to the Harmony database

1. Start Harmony –see [Starting Harmony on page 33](#).
2. In the Toon Boom Harmony window, select the **Connect to Database** option.

3. In the User Name field, type in your Harmony username which is provided by your project lead or system administrator.

4. Click **OK**.

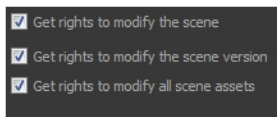

The Database Selector dialog box opens, displaying the environments available in Harmony database.

5. In the Environments column, select the scene's environment (project, movie).

6. In the Jobs column, select the scene's job (episode, sequence).
7. In the Scenes column, select the scene.
8. Get the permissions needed for this session by selecting one of the following options:

A Harmony project can be locked at various levels. Its timing, drawings, version and palettes can be locked. Locking means that you have the rights to modify a scene or its assets. Other users cannot modify locked items. If someone tries to open a locked scene, it will be displayed as read-only.

Here are the different lock possibilities:

Lock	Description
Scene or Version Lock	Controls the Xsheet timing, layers, nodes but not the drawing,

	palettes, palette-lists or templates.
Drawing Lock	Only one user can edit and save a locked drawing.
Palette Lock	Only one user can edit and save a locked palette.
Palette-list Lock	Only one user can edit and save a locked palette-list.
Library Folder lock	Only one user can edit and save into that folder in the Library.

9. Choose the version you want to open from the Version menu—see [Saving Scenes on page 70](#).

- The Saved By and Saved Date fields display the user who last saved the selected scene and the date of the last save.

10. Click **Open**.

About the Global Lock

Harmony Server has a lock system, referred to as Global Lock, for the different scenes and scene assets. Because all the data on the server can be accessed directly and modified from any client machine by default, the scenes are locked. You must obtain the rights to modify scenes in order to save your work on the server.

Only one user at a time can modify a scene. Once a scene is opened on a client machine, other users can only open the scene in read-only mode; they will not be able to save any modifications.

If you work in standalone mode, you automatically have the rights to modify all drawings and palettes.

Global Lock offers three levels which are available from the Database Selector when you log in to Harmony. From there, you can select a scene and obtain the rights to modify it by selecting the desired lock option.

A Harmony project can be locked at various levels. Its timing, drawings, version and palettes can be locked. Locking means that you have the rights to modify a scene or its assets. Other users cannot modify locked items. If someone tries to open a locked scene, it will be displayed as read-only.

Here are the different lock possibilities:

Lock	Description
Scene or Version Lock	Controls the Xsheet timing, layers, nodes but not the drawing, palettes, palette-lists or templates.
Drawing Lock	Only one user can edit and save a locked drawing.
Palette Lock	Only one user can edit and save a locked palette.
Palette-list Lock	Only one user can edit and save a locked palette-list.
Library Folder lock	Only one user can edit and save into that folder in the Library.

There are several different ways to obtain the rights to modify the scenes. It can be done when the user loads a scene from Harmony, inside the application once the scene is loaded, or when an environment, job or scene is created using the Control Center module.

Acquiring Rights to Loaded Scenes

If you opened a scene in read-only mode, but realize that you need to modify it, you can easily acquire the necessary rights without closing and reloading the scene.

Note that it is not possible to acquire the rights to modify the scene assets once the scene is loaded. This process is done during the initial loading of the scene. To learn more about enabling the rights to modify while creating environments, jobs and scenes, refer to the Control Center Guide.

How to set the scene's rights after the scene is loaded

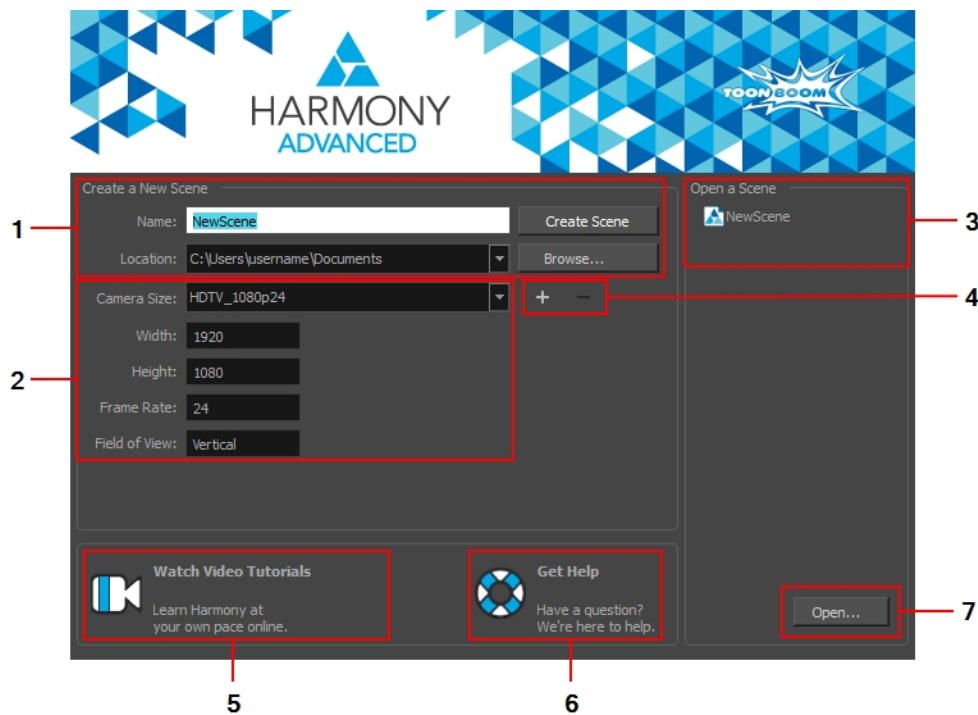

1. In the top menu, select **File** and one of the following:
 - **Rights to Modify Scene:** Allows you to modify the selected version of the scene and access the version manager during the opened session
 - **Rights to Modify Scene Version:** Allows you to modify the currently selected scene version, but locks access to the version manager during the opened session.

About the Welcome Screen

T-HFND-001-003

When you start Toon Boom Harmony, the Welcome screen appears. If a scene is already open, you can display the Welcome screen by selecting **Help > Show Welcome Screen**.

NOTE: If you are using Harmony Server in Database mode, the Welcome screen will not open. Instead, the database selector will open and allow you to open a scene from the database.

The Welcome screen allows you to:

1. Create scenes
2. Choose your scene resolution
3. Quickly open recently edited scenes
4. Manage your scene resolution presets
5. Watch Harmony video tutorials
6. Open the online support page
7. Browse for and open a scene from your documents

About Documentation

The documentation is a way to help you find answers to your questions about how things work in Harmony. The documentation of features and procedures exists online, but you can access it through the software.

A simple, but fast way to find a description of certain menu items and preferences is through the Integrated Help.

Accessing the Documentation

T-HFND-001-004

The Harmony documentation can be accessed from the Welcome Screen and the Help menu.

How to access the Harmony documentation

1. In the Support section, click on the Get Help  button.
Your default web browser opens to the Toon Boom Support page.
2. From the Support page, under the Learn Toon Boom Software section, click on the Documentation button.
The Toon Boom Help page opens.
3. From the Toon Boom Help page, click on the Harmony icon.
The Harmony Help page opens.
All the Harmony guides can also be opened directly in the software. Select **Help > Online Help**.

Using the Integrated Help

If you are unsure about what a certain menu item is in the Top menu or the function of a specific preference in the Preferences panel, use the Integrated Help.

If you keep the Integrated Help window open for the entire duration of your work session, then you can use the forward and backward arrows to scroll through a history of the help information that you called up during your session.

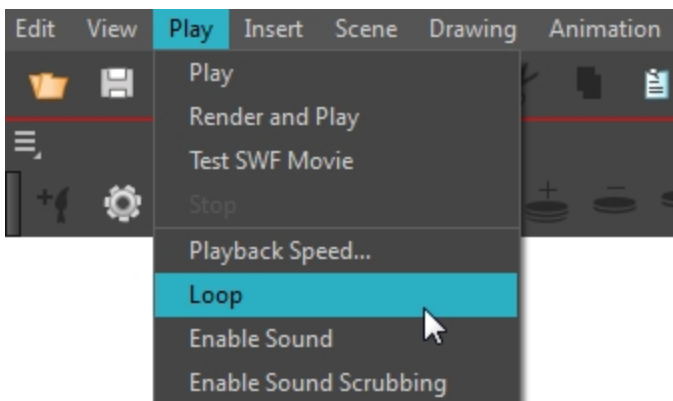

How to use the Integrated Help with Menu Items

1. In the top menu, go to **Help > Show What's This** or press F1 on Windows/Linux or $\text{⌘} + /$ on Mac OS X.

The Integrated Help window appears.

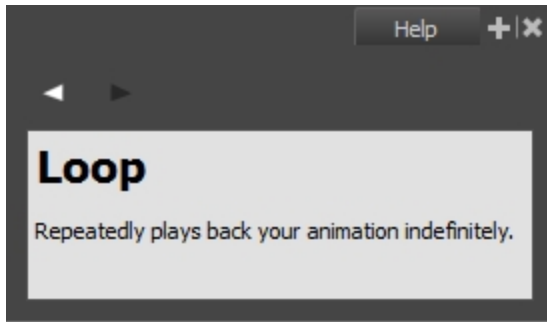

2. In the top menu, click on a menu heading to display its contents.
3. Use your mouse to hover over a menu item.

4. Press F1 on Windows/Linux or $\text{⌘} + /$ on Mac OS X.

In the Integrated Help window, a description of the menu item appears.

How to use the Integrated Help with Preferences

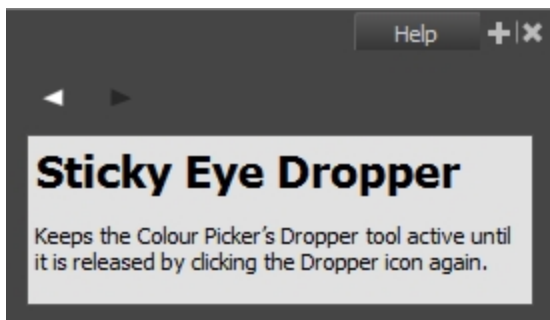

1. In the top menu, go to **Help > Show What's This** or press F1 on Windows/Linux or $\text{⌘} + /$ on Mac OS X. The Integrated Help window appears.

2. In the top menu, go to **Edit > Preferences** (Windows/Linux) or **Harmony > Preferences** (Mac OS X). The Preferences window appears.
3. In the Preferences window, use your mouse to hover over a preference.

4. Press F1 on Windows/Linux or $\text{⌘} + /$ on Mac OS X. In the Integrated Help window, a description of the preference appears.

How to scroll through the bank of searched items

- In the **Integrated Help** window, click on the forward or backward arrow buttons.

NOTE: The moment you close the Integrated Help window all searched items will be erased from the memory bank. In order to keep an on-going record of all the search requests made, you must keep the window open.

About Scenes

When working in production, it is important to keep your work organized. It is important to create a naming convention chart and establish a file storage structure before starting the project. It is not only extremely important that everyone follows the criteria laid out in the naming convention chart and the file storage structure, but also that they understand the organization and where to find the files.

A well thought-out and logical naming convention will help keep your production structured and allow it to run smoothly by preventing the loss of files due to chaotic organization.

In this section, you will learn how to create, open, organize, and name the different components in your animation project.

About the File Structure

T-HFND-001-008

A Harmony project is composed of several files. The drawings and colour palettes are not embedded in the project. They are separate linked files. Therefore, if you want to archive or share a project, you require all the files contained in the folder structure.

For Harmony Server, the scene files as well as user and configuration files are contained within the database structure. If you want to share or archive a project, you will need to use Control Center to export your data from the database. If you receive a package from another user or studio, you will also need to use Control Center to import it in your database. Refer to the Control Center Guide to learn how.

Harmony Server Database Files

All Harmony Server directories are located by default on Windows in C: or on Mac OS X at the root of the main drive where the operating system is installed.

/usa	/usa/nt/bin/	<ul style="list-style-type: none"> • Program directory (.exe)
	/usa/etc/	<ul style="list-style-type: none"> • Configuration files directory
	/usa/etc/flexlm/	<ul style="list-style-type: none"> • License directory
/usa_db		<ul style="list-style-type: none"> • Centralized database containing the structure of all the data that Harmony uses, except for the drawings and final images • Link to the databases (file systems) • User profiles
/usadata		<ul style="list-style-type: none"> • All the data is stored here • All the files including drawings, final frames, and sounds are placed in the different usadata folders • There can be more than one usadata000 file system created, such as usadata001, depending on the disks and the computer's organization

usa_db Structure

The usa_db folder contains the configuration files, database and project structure, as well as shortcuts to scene data. If you browse through usa_db to get to a scene, you will navigate directly to the jobs folder. Even though the root of the project structure is the environment, you will go to jobs. The environment folder contains only the environment list, global environment libraries and configuration files. This means that for different projects, even though jobs are contained in different environments in Control Center, jobs must have unique names as they are physically contained in the same jobs folder.

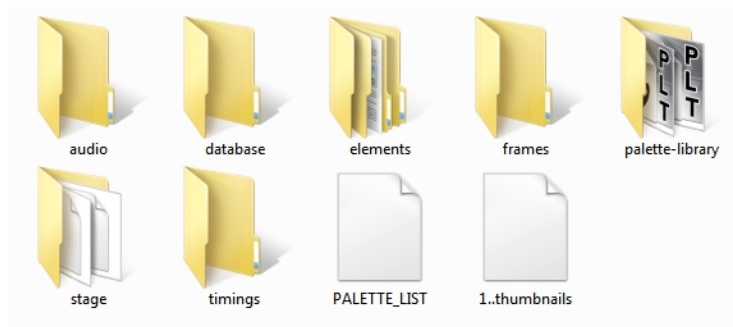

Within the jobs folder, you will find a directory for each individual job. Within each job folder, you will find the folder for the global job library, job palettes, as well as a shortcut for each scene contained in the job. These shortcuts go to the scene data location. Depending on the parameters set upon creating the scene in the Control Center, different scenes may be located on different file systems on different servers, based on storage space and other structure organization.

Scene File Structure

Here is an example of the file structure contained in a scene. As you work and use more features, different folders may appear in your structure.

Harmony Standalone File Structure

Harmony Server File Structure

The Harmony scene folder contains the following folders: frames, audio, elements, etc.

Folder	Contents
annotation	Contains the images and thumbnails created while drawing in an Annotation column in the Xsheet view.
audio	Contains all imported audio files.
database	(Harmony Server) This is no longer used for new projects; it remains for projects created with older versions of the software.
elements	Contains all the drawing files. The drawings are organized by folders named like the layers they are associated with.
environments	(Harmony Stand Alone) Contains the exported palette files that were originally stored at the environment level in the Harmony Server database structure or the palettes in a Harmony Stand Alone scene that will be imported later at the environment level in Harmony Server.

frames	Contains the final frames after a render if you are using the default settings of the Write node in the Node view.
jobs	(Harmony Stand Alone) Contains the exported palette files that were originally stored at the environment level in the Harmony Server database structure or the palettes in a Harmony Stand Alone scene that will be imported later at the environment level in Harmony Server.
palette-library	Contains scene palettes and scene palette list files.
stage	(Harmony Server) Contains multiple versions of a scene. This is useful if you are experimenting with different ways to do a scene. Note that all versions of a scene use the same drawing and palette files.
timings	This folder is used when a user links external images to a scene and wants to store a backup copy in case the link breaks.

Creating Scenes

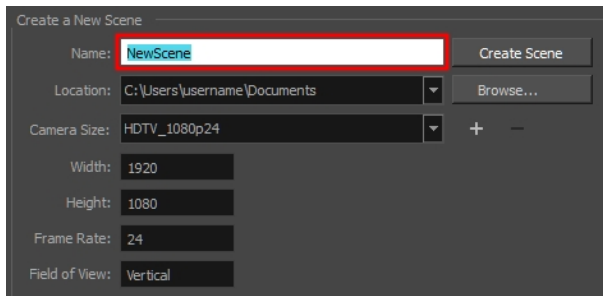

T-HFND-001-005

All scenes created via Harmony Stand Alone are independent and local to the computer. You can create or open a scene using the Welcome screen or the File menu.

In Harmony Server, you cannot create scenes directly in Harmony. You must use the Control Center application.

How to create a scene from the Welcome screen

1. In the **Name** field, type the scene's name.

NOTE: The scene name should **not** exceed 23 characters and cannot contain special characters, such as * & ^ % !.

2. To decide in which directory the scene will be created, click the **Browse** button next to the Location field.

3. From the Camera Size menu, select a scene resolution.

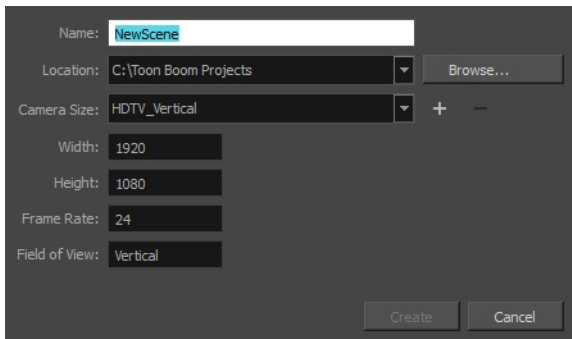

4. Click on **Create Scene**.
A new scene is created.

How to create a new scene from the File menu

1. Do one of the following:

- From the top menu, select **File > New**.
- In the File toolbar, click the New  button.
- Press Ctrl + N (Windows/Linux) or ⌘ + N (Mac OS X).

The New Scene dialog box opens.

2. In the Project Name field, type the scene's name.

3. Select a scene directory by clicking the Browse button.

NOTE: The scene name **cannot** exceed 23 characters and cannot contain special characters, such as * & ^ % !.

4. In the Resolution window, select the scene's resolution and click **Create**.

A new scene is created.

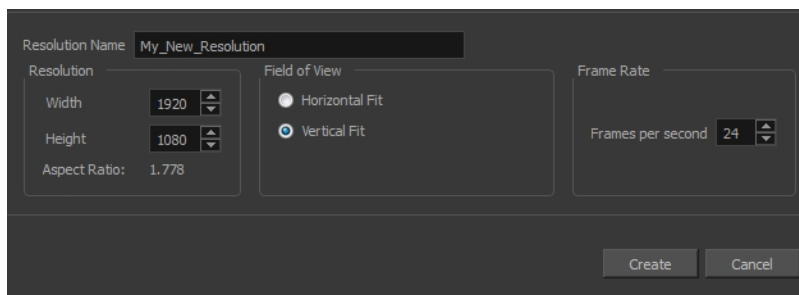

Creating Custom Resolutions

T-HFND-001-006

You can create your own custom resolution presets for your projects.

How to create a custom resolution

1. Create a new scene from the Welcome screen or from the File menu in Harmony.
2. Set the scene resolution by doing one of the following:
 - Select a scene resolution from the Camera sizes drop-down menu.
 - Set a custom resolution by changing the values in the Width and Height fields. This preset will not be saved.
 - Add a new resolution to the list by clicking the Add **+** button. You can delete a custom resolution from the Resolution list by selecting it, and clicking the Delete **-** button.
3. In the New Resolution dialog box, fill in the following fields and click **Create**.

The screenshot shows a dark-themed dialog box for creating a new resolution. At the top, the 'Resolution Name' field is filled with 'My_New_Resolution'. Below this, there are three main sections: 'Resolution' with 'Width' (1920), 'Height' (1080), and 'Aspect Ratio' (1.778); 'Field of View' with two radio buttons, 'Horizontal Fit' (unselected) and 'Vertical Fit' (selected); and 'Frame Rate' with 'Frames per second' (24). At the bottom right, there are two buttons: 'Create' and 'Cancel'.

- **Resolution Name:** Name your new resolution.
- **Resolution:** Set the width, height and aspect ratio of the resolution.
- **Field of View:** Set the horizontal fit and vertical fit.
- **Frame Rate:** Type the scene's frame rate per second.

Opening Scenes

T-HFND-001-007

You can open scenes from the Welcome Screen and the File menu. You can also open your recent scenes.

How to open a scene from the Welcome screen

1. In the Recent Scenes section, click **Open**.
The Open Scene browser opens.
2. Browse and select an ***.xstage** file.
3. Click **Open**.

How to open a scene from the File menu

1. Do one of the following:
 - From the top menu, select **File > Open**.
 - In the File toolbar, click the Browse  button.
 - Press Ctrl + O (Windows/Linux) or ⌘ + O (Mac OS X).

The Open Scene browser opens.

2. Browse and select the desired ***.xstage** file.
3. Click **Open**.

How to open a recent scene from the Welcome screen

1. In the Open a Scene section, select a scene from the list.

How to open a recent scene from the File menu

1. From the top menu, select **File > Open Recent**.
2. Select a scene from the displayed list.

Setting the Scene Length

T-HFND-001-009

Once you have opened your scene, you can set its length.

NOTE: Refer to the Scripting guide to learn how to modify the New Scene Start up script to set a different default scene length.

How to set the scene length

1. Select **Scene > Scene Length**.

The Set Scene Length dialog box opens.

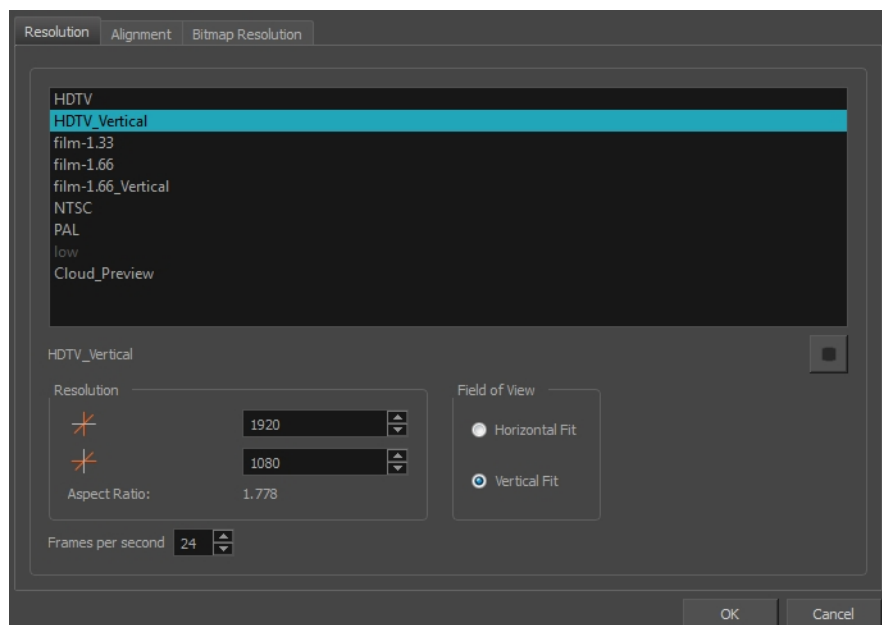

2. In the Number of Frames field, enter the number of frames needed.

About Scene Settings

T-HFND-001-010

When you created your new scene, you set up the resolution and the alignment. However, if you want to change these initial settings later, you can do it using the Scene Settings dialog box. The different Scene Settings options are separated into four tabs.

NOTE: Refer to the Scene Setting dialog box in the Reference guide to learn more about the individual parameters of the Scene Settings dialog box.

How to access the Scene Settings dialog box

1. Select **Scene > Scene Settings**.

The Scene Settings dialog box opens.

About Scene Versions in the Harmony Server

Harmony Server allows you to save, delete and merge versions on your scene. You can add descriptions to every saved version, in order to retain a record of all the changes made to the scene. When merging two versions, you can choose which differing elements to merge. When using the Advanced Save feature, you can choose to save specific drawings, palettes and palette lists.

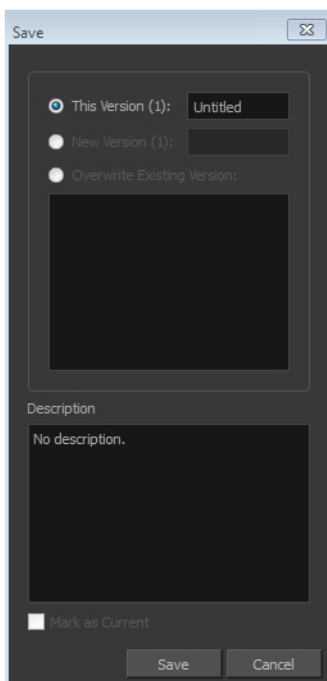

Saving Scene Versions in the Harmony Server

Save different versions of your scene and add a description to keep track of the changes made.

How to save the current version of a scene in Harmony Server

1. Make sure you have the necessary rights to save the current scene version. If you do not, you can acquire the rights by selecting **File > Rights to Modify Scene Version** or **Rights to Modify Scene**.
2. From the top menu, select **File > Save** or press Ctrl + S (Windows/Linux) or ⌘ + S (Mac OS X).

When saving the scene for the first time, the Save dialog box opens, prompting you to name the version.

3. Edit the information in the current version:

- In the This Version field, enter a relevant name for the current version.

- In the Description field, enter a short description of the current version.

4. Click **Save**.

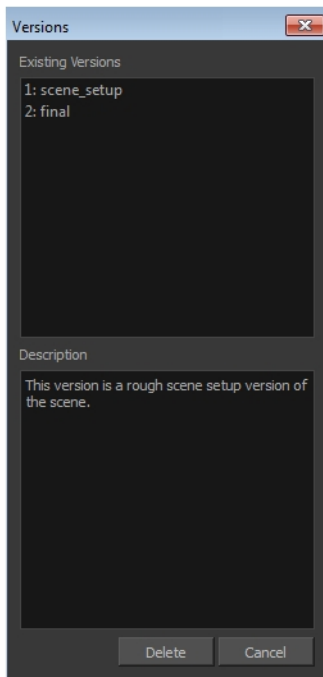

Deleting Scene Versions in the Harmony Server

View a list of the different versions of your scene, along with their corresponding description. Use this information to delete various versions.

How to delete versions

1. Make sure you have the necessary rights. If you do not, select **File > Rights to Modify Scene**.
2. Select **File > Manage Versions**.

The Versions window opens.

3. In the Existing Versions list, select the scene version you want to delete. When a version is selected, information about it appears in the Description area.
4. Click **Delete**.

The Confirm Delete Versions dialog box opens, warning you that the operation cannot be undone.

5. Click one of the following:
 - **Yes: ONLY** if you are absolutely certain that the version can be deleted.

- **No:** To cancel the operation and keep the version.

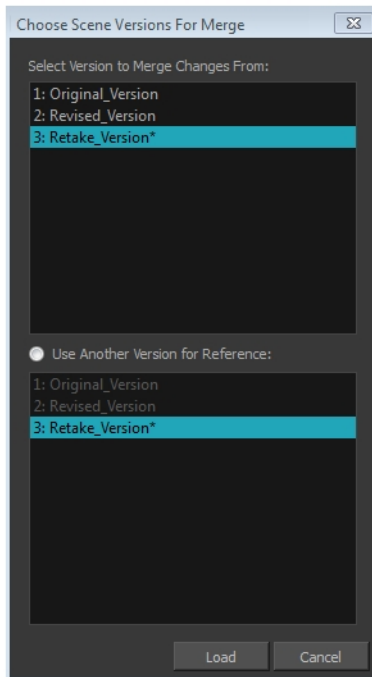

Merging Scene Versions in the Harmony Server

If you have two different versions of a scene that need to be brought together, you can merge them.

How to merge scene versions

1. From the top menu, select **Edit > Open Merge Editor**.

The Choose Scene Versions for Merge window opens.

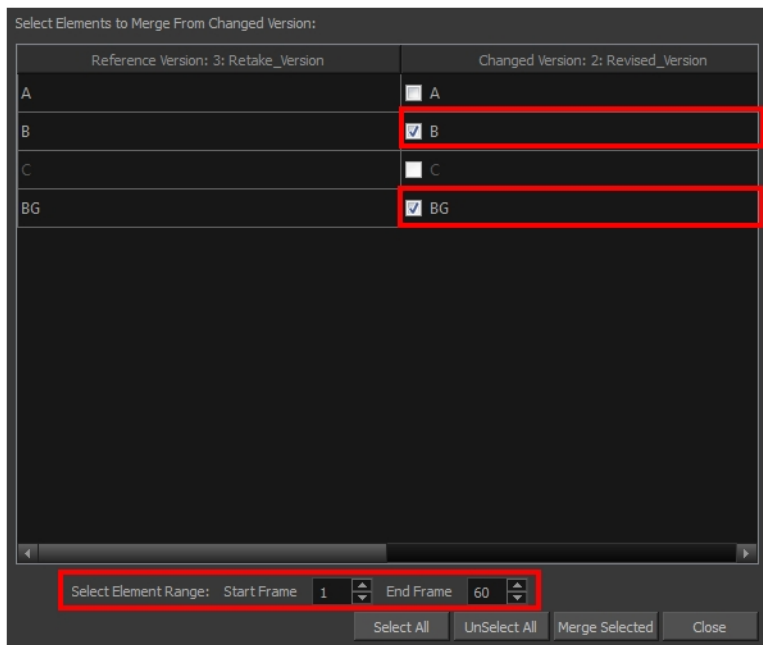

2. In the Select Version to Merge Changes From list, select the scene version from which you want to merge the changes from in your current open version.

In the Use Another Version for Reference section, you can select a different scene version to merge the changes into, rather than your current version.

3. Click **Load**.

The Merge Editor opens.

4. From the right column, select the layers you want to merge the changes from into the reference version.
5. In the Select Element Range section, set the Start Frame and End Frame fields to indicate from what frame to what frame you want to take the changes from.
6. Click **Merge Selected** to complete the operation.

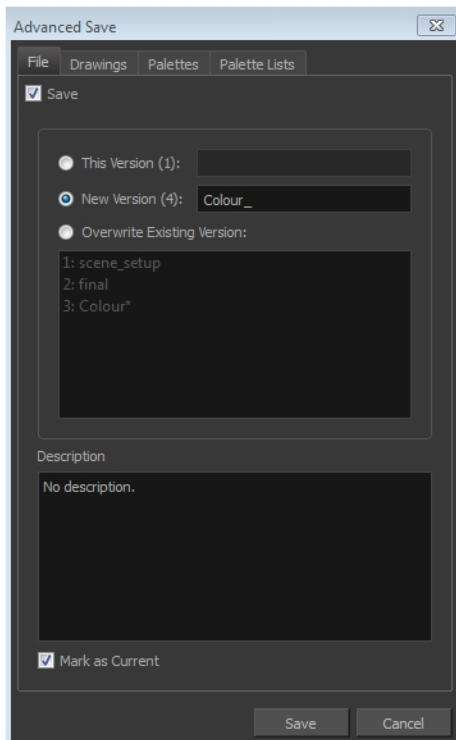

Advanced Saving in the Harmony Server

Use the Advanced Save dialog box to save specific drawings, palettes and palette lists as a version of your scene.

How to use the Advanced Save dialog box

1. Make sure that you have the necessary rights to save the current scene version. If you do not, you can acquire the rights by selecting **File > Rights to Modify Scene Version** or **Rights to Modify Scene**.
2. From the top menu, select **File > Advanced Save**.

The Advanced Save dialog box opens—see the Reference guide for detailed parameter descriptions.

Opening Drawings in Paint

This option will let you load drawings from one element at a time, for quick ink and paint on a single layer animation.

How to open drawings in Paint

1. Once Paint is launched and you are logged in, select **File > Open Drawings**. Press Ctrl + O (Windows/Linux) or ⌘ + O (Mac OS X).

The Database Selector opens, displaying the Environments available from the Harmony database.

2. Select the Environment, Job, Scene and Element where the drawings you need to paint are located.

3. Choose the version you want to open from the Version drop-down menu.

- The Saved By and Saved Date fields display the user who was the last to save the selected scene and the date of the last save.

4. Click on the Open button.

The Drawings Selector dialog box opens.

5. Select the desired drawings from the drawings list:

- Click on a single drawing to select it.
- You can create a continuous multiple selection by holding the Shift key.
- You can create a multiple selection by holding the Ctrl (Windows/Linux) or ⌘ (Mac OS X) key.
- Click on the All button to select all the drawings that are listed in the Drawings Selector.
- Click on the Unpainted button to select all the drawings whose status appears as UNPAINTED.
- Click on the Painted button to select all the drawings whose status appears as PAINTED.

6. Click **OK**.

The selected drawings appear in the Drawing Thumbnails view

7. Use the Control panel to navigate between the previous and next drawings. Press F and G.

You are now ready to ink and paint!

Opening Elements in Paint

This option will let you load drawings from several elements at once. This can be useful when an animation is separated in many layers, to insure that they are well aligned and that the painted shapes and lines fit together. A good example of this would be a dialogue with the chin and mouth separated from the rest of the head.

How to open elements in Paint

1. Once Paint is launched and you are logged in, select **File > Open Elements**. Press **Ctrl + E** (Windows/Linux) or **⌘ + E** (Mac OS X).

The Database Selector opens, displaying the Environments available from the Harmony database.

2. Select the Environment, Job and Scene where the elements containing the drawings you need to paint are located.

3. Choose the version you want to open from the Version drop-down menu.

- The Saved By and Saved Date fields display the user who was the last to save the selected scene and the date of the last save.

4. Click on the **Open** button.

The Open Elements dialog box opens.

5. Select the elements you need to paint from the Elements list:
 - You can create a continuous multiple selection by holding the Shift key.
 - You can create a multiple selection by holding the Ctrl (Windows/Linux) or ⌘ (Mac OS X) key.
6. Select the frames you wish to load from the Frames list:
 - You can create a continuous multiple selection by holding the Shift key.
 - You can create a multiple selection by holding the Ctrl (Windows/Linux) or ⌘ (Mac OS X) key.
 - Click on the All Frames button to load all the frames of the scene.
7. Click **OK**.

The Drawing Thumbnails view is hidden and your selected elements are loaded in Paint.

8. Enable the Light Table  option from the Drawing view toolbar to display all the drawing layers.

The selected layer are displayed in original colours and the other layers are displayed as washed out colours.

9. Use the Control Panel to navigate between previous and next layers. Press H and J.

10. Use the Control panel to navigate between previous and next drawings. Press F and G.

You are now ready to ink and paint!

About Saving

It is important to regularly save your scene. As you make changes to a scene, an asterisk (*) appears in the title bar beside the scene name to indicate that the scene contains unsaved changes.

To save the current state of a scene as another scene, you can use the Save As command. The Save As window prompts you to give a new name and choose a different location to this scene before saving it. This will create a complete scene directory for the new scene. The Save As command is not available in Harmony Server.

It is quite frequent, when working on a scene, to try out different timings, effects, camera motions or parameters to see which one will work best. Harmony allows you to save a new version of your scene. It is really important to note that the drawings and palettes are the same between ALL the scene versions. You can modify the timing, effects, parameters and camera motion, but if you modify the drawings, they will be changed everywhere.

You can also automatically save your work. Refer to the Preferences Guide to learn more about this function.

When you use Harmony Server and work in a scene on the database, there are many choices and options available when you save your work.

Lets you do the following:

- Save the scene as the current version.
- Save different versions representing different stages of the production of your scene.
- Save different versions representing different scene setups.
- Choose specific assets that you want to save, such as drawings or palettes.

When you open the scene from the database and select the version you want to edit, you can save the changes you made in the current version or create a new version. The simplest way to save your work is to update the current version.

You can delete any unnecessary versions using the Versions window.

When working with multiple versions, you may want to merge some of the changes from one version into another. You may have created a version with some suggestions that you submitted to the director while continuing to work on the official version. If the director has approved some of the changes, you can go ahead and import them into the official version.

You might want to save some specific aspects of your scene or save a new version. The Advance Save feature allows you to do this. Once you have chosen the components to save, you will conclude the procedure by following the instructions in the section. All the specific components that are selected throughout the different tabs of the Advanced Save dialog box will be saved.

Saving Scenes

T-HFND-001-011

You can save your scene, save a new copy or save a new version. Don't forget that saving a new version uses the same drawings in all versions. Harmony Server doesn't let you save your scenes as new copies.

How to save a scene

- Select **File > Save**.
- Press **Ctrl + S** (Windows/Linux) or **⌘ + S** (Mac OS X).

Saving Scenes as Copies

Saving a copy of your scene allows you to choose a new file name and location for your scene.

How to save a scene as a copy (Harmony Stand Alone)

1. Select **File > Save As**.
2. In the Save As dialog box, browse to the location of the new archive and give the copy of the scene a new name. The name cannot exceed 23 characters.
3. Click **Save**.

Saving Scenes as New Versions

Saving a new version of your scene allows you to save your scene at its current location, under a new file name.

How to save a new version of a scene (Harmony Stand Alone)

1. Select **File > Save As New Version**.

The Save Version dialog box opens.

2. In the Save Version dialog box, type the new version name.
3. Click **OK**.

Auto-Saving Scenes

T-ANIMPA-001

You can allow the software to automatically save your scene, as well as decide on the length of time between saves.

How to auto-save a scene

1. Do one of the following:
 - Windows/Linux: Select **Edit > Preferences**.
 - Mac OS X: Select **Harmony Advanced > Preferences**.
 - Press Ctrl + U (Windows/Linux) or ⌘ + U (Mac OS X).
2. Select the **General** tab.
3. In the Save section, set the Auto-Save parameters:
 - **Interval (minutes)**: This is the frequency at which the auto-save takes place.
 - **Inactivity Interval (seconds)**: When Auto-save is about to take place, it verifies if you are drawing or doing anything in the application. If so, Auto-save waits this number of seconds before attempting another save.
 - **Ask Before Saving**: Before performing an auto-save, you are prompted with a message to confirm if you want to save or not. You can choose to turn off this option.
 - **Enabled**: This enables the Auto-save feature. If you do not want the system to automatically save your work, deselect this option. The auto-save is off by default.

About Drawing Lock

The drawings are stored on the server database providing access to them from every client machine. They are locked to avoid different users from modifying the same drawings simultaneously. Only one person at a time can get the rights to modify them. The drawing rights are independent from the scene rights because in a production rush, two users may need to work on the same scene to finish painting the drawings faster. One user will get the rights for one set of drawings, and the second user the rights to another set of drawings. This prevents work from being duplicated.

When enabled, the Edit Drawings mode gives you the right to modify drawings, as well as create new drawings by drawing directly on an empty cell. This mode is enabled by default when you open a scene version with the rights enabled.

NOTE: If you open the scene with full rights from the Welcome screen or Control Center, the Edit Drawing mode is not available.

When you disable the Edit Drawing Mode, you can use the Get Rights to Modify Drawings option on a selection of specific drawings. This is useful when, for example, many users are working on the same scene during the ink and paint process and they want to split the drawings to paint between them.

Also, once you got the rights to modify drawings, you can release these rights if necessary.

If your system crashes and the drawings remain locked, you can force the release of the rights. You must use this option carefully as data loss may occur if the scene is currently open and being edited by another person. Verify that no one else is using the scene prior to forcing the release of the drawing rights.

Since the drawings are stored on the server, you might at times need to refresh the drawings that are displayed in your scene.

Locking Drawings

You can acquire and release the rights to modify drawings when working with Harmony Server.

How to enable the Edit Drawing Mode

- From the top menu, select **Edit > Edit Drawing Mode**.

How to get the rights on a selection of drawings

1. Make sure that the Edit Drawing Mode is disabled.
2. In the Xsheet view, select the drawings you want to edit.
3. Select **Edit > Get Rights to Modify Drawings** or press Alt + L.

How to release the rights on a selection of drawings

1. In the Xsheet view, select the drawings you want to release.
2. Select **Edit > Release Rights to Modify Drawings** or press Alt + Shift + L.

How to force the release of the rights of locked drawings

1. In the Xsheet view, select the drawings you want to release.
2. Select **Edit > Force Release Rights to Modify Drawings**.

A Warning dialog box opens.

- Click **Yes** if you want to continue to force the release.
- Click **No** if you want to cancel the force release.

How to read changed drawings

- Select **File > Read Changed Drawings**.

Verifying the Project Integrity

The Check Files command verifies the integrity of the drawing and palette files in your project. Use the Check Files dialog box to verify that the data is consistent, correct, and accessible.

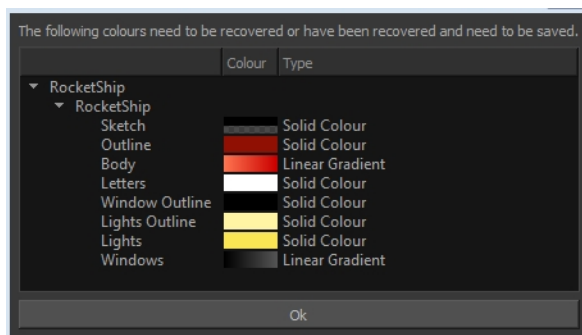

How to open the Check Files dialog box

1. From the top menu, select **> Check Files**.

2. Click **Check Colours** to open the Check Colours dialog box.

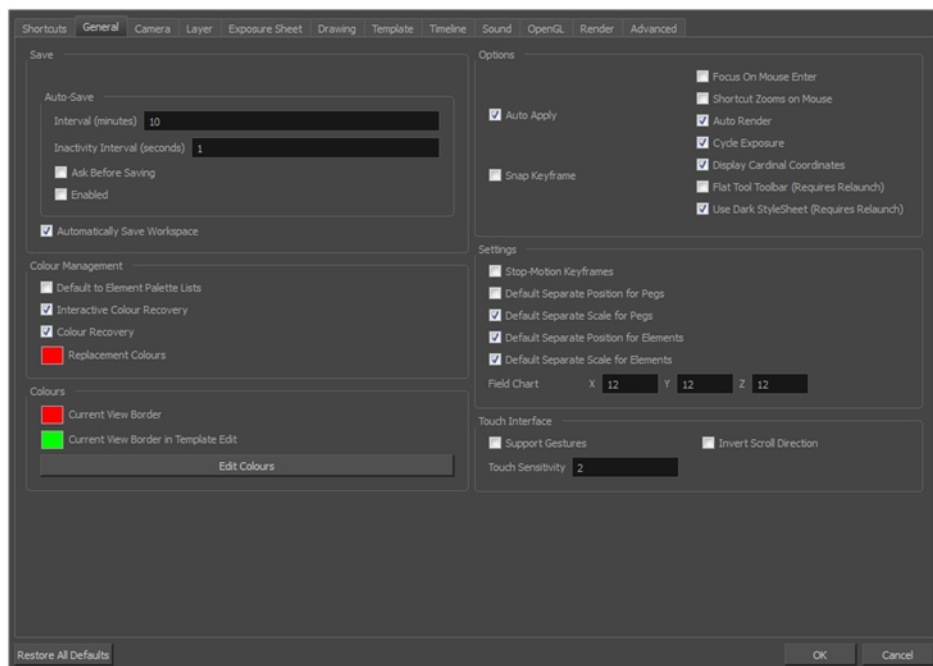

The Check Colours dialog box checks the palette integrity and displays the colour recovery data.

About Preferences

An important feature of Toon Boom Harmony is the Preferences dialog box. From here you can customize your interface, tool behaviour and shortcuts. Throughout this guide, you are often required to go to the Preferences dialog box to set parameters and options.

NOTE: To learn about the different preferences available, refer to the Preferences Guide.

When working with Harmony Stand Alone, your custom preferences are stored in:

- **Windows:**

- **Toon Boom HarmonyPremium:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony Premium \full-1400-pref
- **Toon Boom HarmonyAdvanced:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony Advanced\full-1400-pref
- **Toon Boom HarmonyEssentials:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony Essentials\full-1400-pref

- **Mac OS X:**

- **Toon Boom Harmony Premium:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Harmony Premium/full-1400-pref

- **Toon Boom Harmony Advanced:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Harmony Advanced/full-1400-pref
- **Toon Boom Harmony Essentials:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Harmony Essentials/full-1400-pref

On Mac OS X, the Library folder is a hidden folder. To display the display the folder, told down the Alt key.

- **Linux:**

- /home/[user_name]/Toon Boom Animation/Toon Boom Harmony Premium/full-1400-pref/
- /home/[user_name]/Toon Boom Animation/Toon Boom Harmony Advanced/full-1400-pref/

When working with Harmony Server, your custom preferences are stored in:

- **User:** [Server_Name] > USA_DB > users > [user_name] > stage > full-1400-pref

How to open the Preferences dialog box

1. Do one of the following:

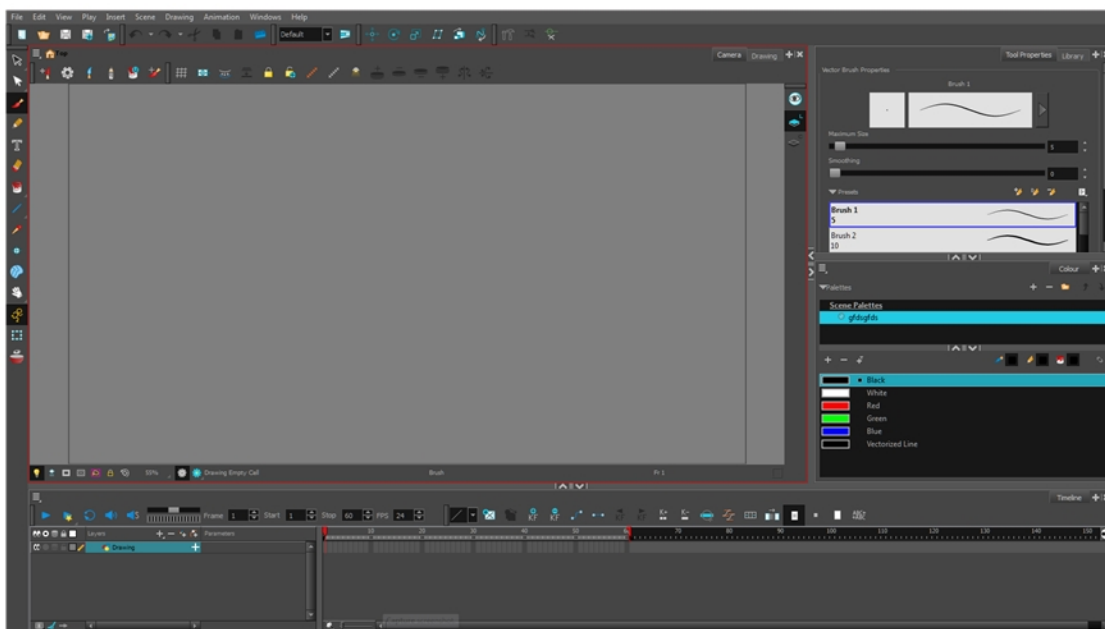

- Windows/Linux: From the top menu, select **Edit > Preferences**.
- Mac OS X: Select **Harmony Advanced > Preferences**.
- Press Ctrl + U (Windows/Linux) or ⌘ + U (Mac OS X).

Chapter 3: Interface

T-HFND-003-001

Knowing how to manage the Toon Boom Harmony interface helps you to work efficiently and organize your workspace conveniently. There are a series of views and toolbars you can use as you perform different operations. Usually, each person has a specific way of working in the interface and prefer particular views and toolbars. In this chapter, you will learn about the main elements of the interface and how to manage them.

NOTE: To learn more about each view's properties, see the Reference guide.

NOTE:

On Windows, the default high-dpi setting was disabled so that text and UI element are shown properly. The application will appear a bit blurry but the text and UI elements will be displayed properly.

The previous behaviour is available by starting the application, **Harmony [edition] .exe**, from the command line using the **-enableHighDpi** option.

To not have to start using the command line, the shortcut to start Harmony can be modified to add the option at the end of the target:

```
"C:\Program Files (x86)\Toon Boom Animation\Toon Boom Harmony 14.0 Premium\win64\bin\wstart.exe"
Harmony[edition].exe -enableHighDpi
```

Replace the [edition] portion with the name of your edition (capitalized).

Changing the Theme Colours

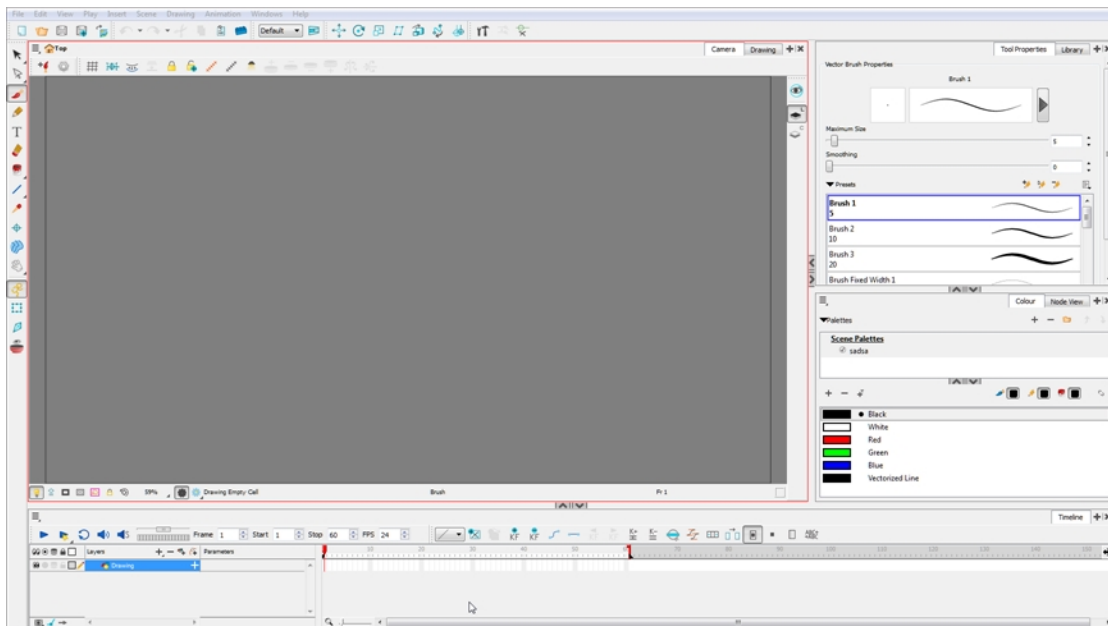

The Harmony interface is set to a dark theme by default. You have the option of switching to a light theme.

How to change the interface theme

1. From the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X) .

The Preferences dialog box opens.

2. Select the **General** tab.
3. In the Options section, deselect the **Use Dark StyleSheet** option to use the light theme.
4. Restart Harmony.

Changing the User Interface Language

Harmony is available in English, Spanish, Japanese, and Chinese. Harmony will automatically change to your OS language if it corresponds to one of these four languages. If you would like to start Harmony in one of those languages independently from your OS, you can use the command prompt or terminal to do so.

How to start Harmony using a specific user interface language

1. Start a terminal, command prompt, or shell on your OS.
2. Using the change drive command (cd), navigate to the Harmony executable file location:
 - Windows: `C:\Program Files (x86)\Toon Boom Animation\Toon Boom Harmony 14.0 Premium\win64\bin`
 - Mac OS X: `/Applications/Toon Boom Harmony 14.0 Premium/tba/macosx/bin/`
 - Linux: `/usr/local/ToonBoomAnimation/harmonyPremium_14/lnx86_64/bin/`
3. To start Harmony in a specific language, type in the name of the Harmony application including the language argument (-lang) and language code (two letters):
 - Windows:
 - English: `HarmonyPremium.exe -lang en`
 - Chinese: `HarmonyPremium.exe -lang zh`
 - Japanese: `HarmonyPremium.exe -lang ja`
 - Spanish: `HarmonyPremium.exe -lang es`
 - Mac OS X:
 - English: `Harmony\ Premium -lang en`
 - Chinese: `Harmony\ Premium -lang zh`
 - Japanese: `Harmony\ Premium -lang ja`
 - Spanish: `Harmony\ Premium -lang es`
 - Linux:
 - English: `HarmonyPremium -lang en`
 - Chinese: `HarmonyPremium -lang zh`
 - Japanese: `HarmonyPremium -lang ja`
 - Spanish: `HarmonyPremium -lang es`
4. Press Enter/Return to validate and launch Harmony in the desired language.

About Menus

T-HFND-003-002

Harmony contains three types of menus from which you can access many commands and options:

Top Menu

The top menu contains most of the commands. Depending on the view you're working in and the element, some commands are available and others are not. The top menu is always located at the very top of the interface.

The top menu contains the following categories:

- File
- Edit
- View
- Play
- Insert
- Scene
- Drawing
- Animation
- Windows
- Help

On Mac OS X, there is also a Harmony Advanced category that contains the following commands:

- Preferences
- About
- Quit

View Menu

A view menu contains commands specifically related to that view.

To access a view menu, click the Menu  button in the top-left corner of a view.

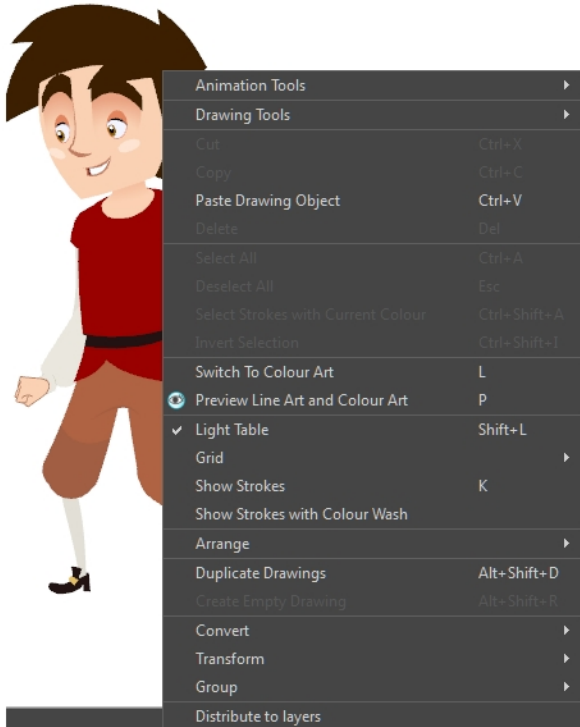

A view menu is available in the following views:

- Camera
- Colour
- Drawing
- Function
- Library
- Model
- Perspective
- Script Editor
- Side
- Timeline
- Top
- Xsheet

Quick Access Menu

A quick access menu lets you open a list of the commands you will use most often.

To access this menu, right-click anywhere in a view.

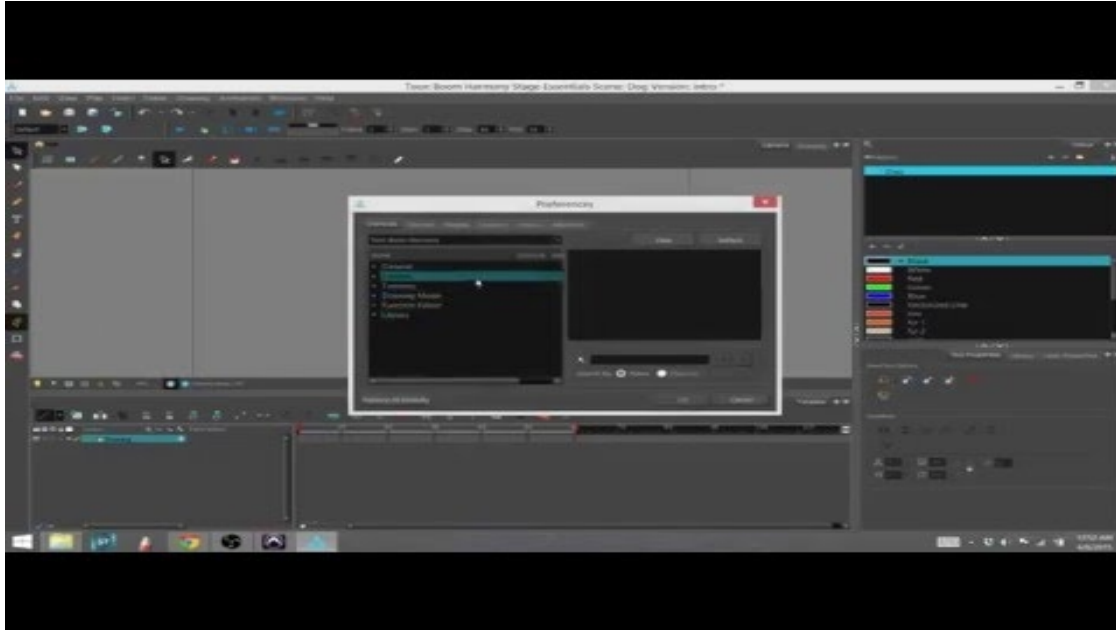

Nautilus © Gava Productions and Indiana Productions

About Toolbars

T-HFND-003-003

Harmony contains toolbars which, by default, are located at the top of the interface. Some of the views also have their own toolbars which you can move around. You can reposition the toolbars to suit your work style or hide unused ones.

NOTE: Throughout this section, there may be slight differences between your interface and the illustrations in this guide. This is because the images are taken from Harmony Premium.

You can display or hide toolbars using the menus. The Toolbar menu only contains the View toolbars of the views that are displayed in the workspace. As you show or hide views in your workspace, the Toolbar menu updates.

The top toolbars can also be displayed directly in a view. Only one instance of each toolbar can be displayed. If a toolbar is already displayed in the top area and you decide to display it in a view, the selected toolbar will move from the top area to the view.

The toolbars in any of the views can be customized with your favourite tools. Using the Toolbar Manager dialog box, you can organize different toolbars to suit your working style.

If the default toolbar does not contain the tools you require, you can customize the toolbar.

If you prefer to have all your tools visible in the Tools toolbar, the Flat Tool Toolbar option allows you to expand the toolbar so there are no nested toolsets in the toolbar. When you set this option, you will need to close Harmony and restart it for the new interface to be displayed. A default set of tools will appear in the toolbar. However, you can customize the toolbar with the tools that more closely fit your work pattern.

The default Tools toolbar

These arrows denote nested toolsets.

The Flat Tool Toolbar option expands the toolbar so there are no nested toolsets.

Once you are displaying the flat toolbars, you can customize the tools which appear in the toolbar. This means that you can change the default set of tools and replace the tools you use less frequently with ones use more often. This customizing is done through the Toolbar Manager.

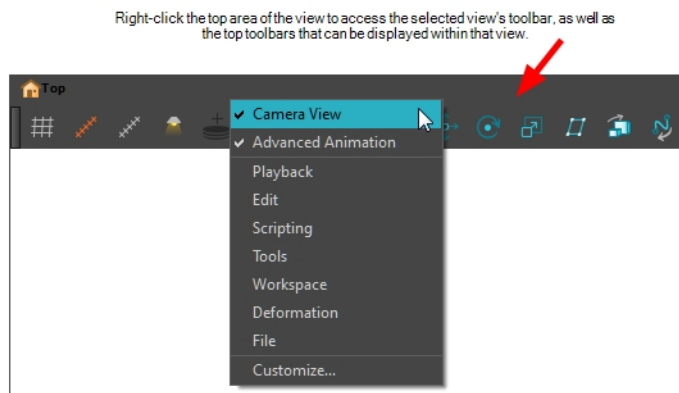

Adding Toolbars

T-HFND-003-004

You can add toolbars simply by using menus.

How to add or close a toolbar

1. Select **Windows > Toolbars > toolbar**.
 - You can right-click anywhere in the toolbar area to access Harmony toolbars. View toolbars, however, are not available by right-clicking the toolbar area. You can access the toolbar of any open and active view by right-clicking in the view's top area or the Windows menu.

Moving Toolbars

T-HFND-003-005

You can move toolbars simply by dragging them to a new location.

How to move a toolbar

1. Select the toolbar you want to move by clicking its anchor point and dragging it into a view toolbar area or another position in the top or side interface toolbar area.

2. When a highlighted zone appears showing an available location for the toolbar, release the mouse button and drop the toolbar into position.

Resizing Toolbars

T-HFND-003-006

You can resize a toolbar by sliding its tail-end.

How to resize a toolbar

1. Hide a portion of a toolbar by dragging another open toolbar over its tail-end.
2. Click on the arrows appearing at the end of the collapsed toolbar to expand it.

Customizing View Toolbars

T-HFND-003-007

You can customize a view toolbar to add, remove, and reorder icons.

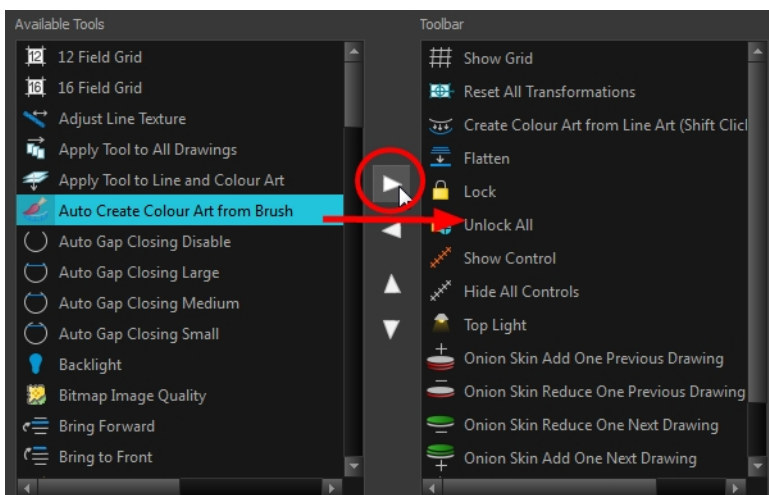

How to customize a view toolbar

1. In the chosen view, right-click on any button in the toolbar where you want to add or subtract a new button. You can also reorder the buttons. Make sure the button you right-click on is active.
2. From the menu, select **Customize**.

The Toolbar Manager window opens.

3. To add a new icon to your toolbar, select the tool or command from the Available Tools list and click the Right Arrow ► button to switch it to the Toolbar list.

4. To remove an icon from your toolbar, select the tool or command in the Toolbar list and click the Left Arrow ◀ button to switch to the Available Tools list.

5. To reorder the icons in your toolbar, select the command to be moved from the Toolbar list and click the Up ▲ or Down ▼ buttons to move it to the correct location.

6. Click **OK** when you are finished.

Enabling the Flat Toolbar

Delete this text and replace it with your own content.

How to use enable the Flat Tool Toolbar preference

1. From the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
2. In the Preferences dialog box, select the **General** tab.
3. Select the **Flat Tool Toolbar** option.
4. Click **OK**.
5. Save your work and close Harmony.
6. Restart Harmony.

The Tools toolbar no longer contains nested tools.

About Views

T-HFND-003-008

The Harmony interface is composed of different views, each one designed for a specific purpose. You can modify the location of the views by adding a new view as a tab or as a window. You can also swap the location of a view.

When a view is active, a red rectangle appears around the view. Keyboard shortcuts and top menu options are associated with the active view. If a menu option is greyed out, it means it does not apply to the layer, drawing or other type of selection or the option does not apply to the active view.

NOTE: To learn more about each view's properties, refer to

Workspace modifications are automatically saved when you exit the application unless you deselected the Automatically Save Workspace option in the Preferences dialog box.

Adding Views

T-HFND-003-009

You can easily add views through the top menu or each view.

How to add a view to your workspace as a tab

1. In the top-right corner of an existing view, click the Add View **+** button
2. Select a view from the list. Some views, such as the Camera, Perspective, Library and Model views, can be opened in multiple instances. For example, this can be useful if you want to have two Camera views open, each focused on different areas of your scene, to quickly switch between working on these two areas.

The view will appear as a new tab in the same section of your workspace:

How to add a view to your workspace as a window

1. Open the **Windows** menu.

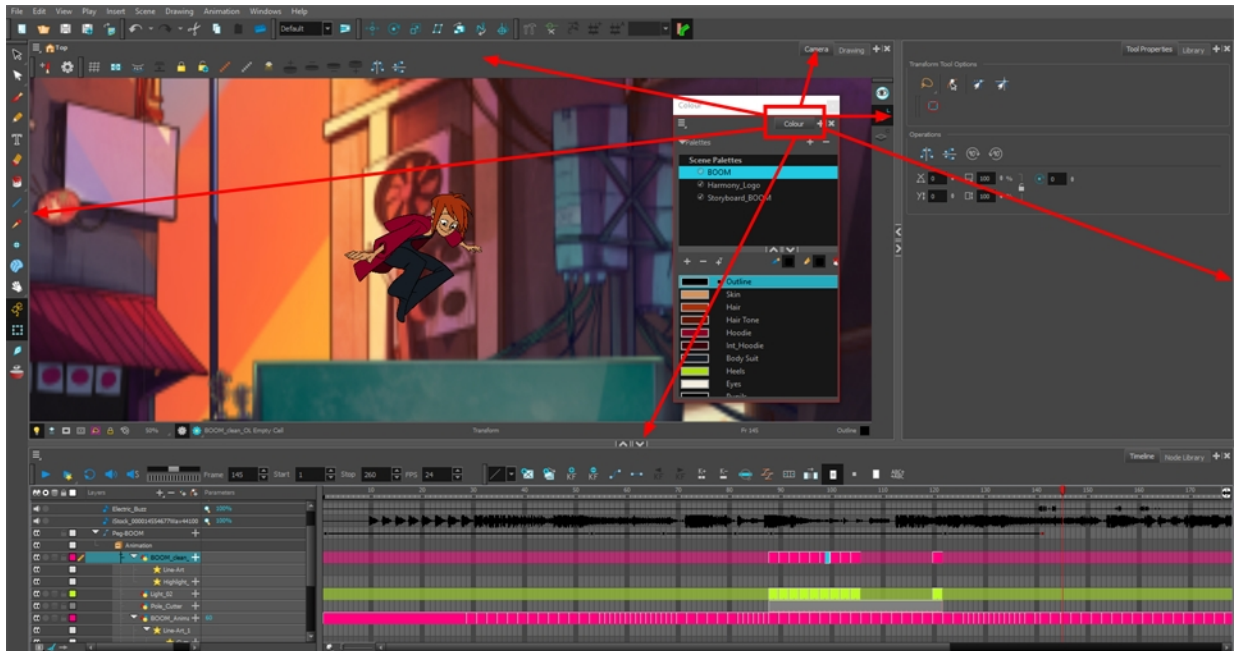

2. Select the view you wish to add.

The view will appear as a new window over Harmony's main application window.

How to dock a view window to your workspace

1. Drag a window by its tab and do one of the following:

- Drop the window onto other existing tabs to add it to that set of tabs.
- Drop the window above, below or beside an existing view. When you get close to the edge of a view, a black rectangle with a blue background appears, indicating where the view will be inserted.

Closing Views

T-HFND-003-010

You can close one or multiple views by using their closing button.

How to close a view

1. Click the Close View  button.

If there are several tabs in the same view, press Shift and click the Close View  button to close all tabs at the same time.

Showing and Hiding Views

T-HFND-003-012

You can temporarily show and hide views using the collapsing buttons.

How to temporarily hide a view

1. On the edge of the window you want to hide, click the **Collapse/Expand** button.
The view is compressed and only the Collapse/Expand button is visible.
2. Click the **Collapse/Expand** button again to redisplay the view.

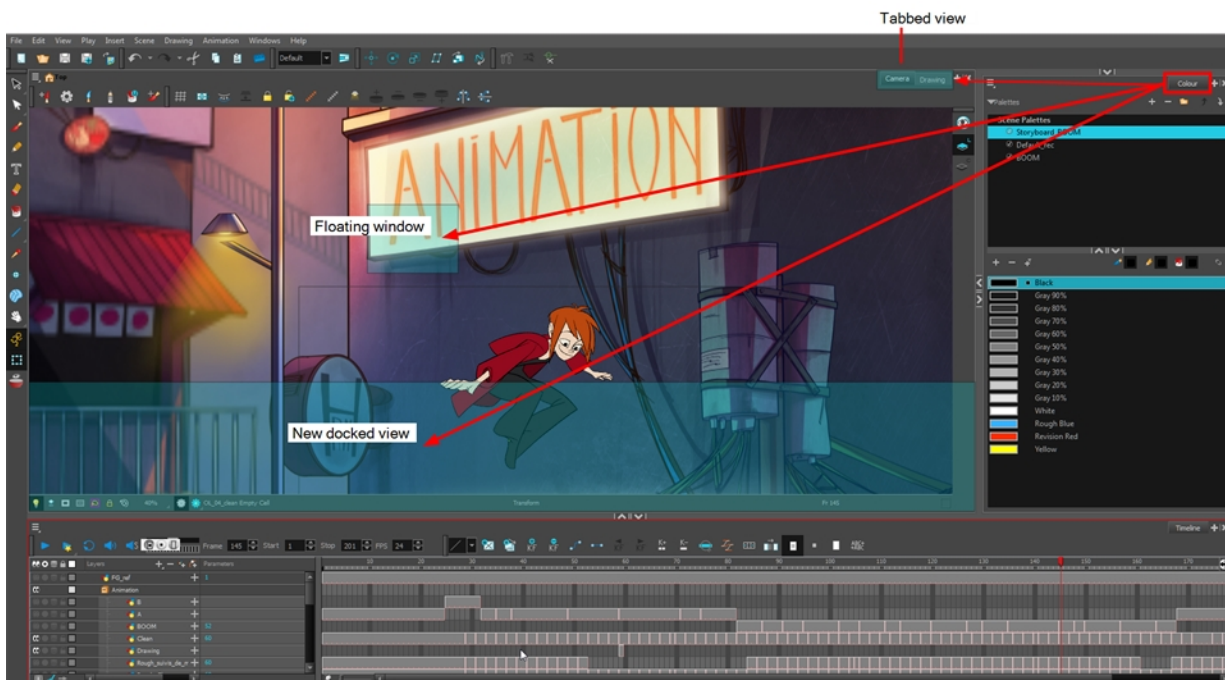

Moving Views

T-HFND-003-011

You can move views by dragging their name tab to a new location.

How to move views

1. Select the view's tab and drag it onto one of the view's separators, top area or onto another view's tab.
2. When a blue rectangle outline appears showing an available location for the view, release the tab to drop the view into position. One of three things will happen:

- The view becomes a tabbed view.
- The view becomes a floating window.
- The view becomes a new docked view.

Resizing Views

T-HFND-003-013

You can resize a view by sliding its edges.

How to resize a view

1. Place the pointer on the edge of the view to resize.
2. When you see the Resizing $\leftarrow\rightarrow$ icon, drag the side of the view to the desired size.

About Workspaces

T-HFND-003-014

The Harmony interface is composed of several views. You can customize your workspace to suit your working style, save it as a new workspace, and load it from the Workspace toolbar.

The first time you open Harmony, the default workspace is loaded. Other workspaces are available such as the Hand-Drawn Animation and Compositing workspaces. These display different views and toolbars. You can access these workspaces, and any others you create, from the Windows menu and the Workspace toolbar.

By default, when you modify the look of a workspace, it is automatically saved. If you prefer to keep your workspaces as they are and only save the modifications when you really want to, you must disable the Automatically Save Workspace option.

The Workspace Manager allows you to modify, create, delete, rename and reorder you workspaces. You can save your workspace as a new version to avoid over-writing the current one. If you do not want to modify the current workspace, use the Workspace Manager to create another one and then modify that one.

Your customized preferences are stored in the following location and you can save them to either share with someone else, copy to a second computer or simply back them up.

When working with Harmony Stand Alone, your custom workspaces are stored in:

Windows

- **Toon Boom Harmony Premium:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony\1400-layouts.xml
- **Toon Boom Harmony Advanced:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Advanced\1400-layouts.xml
- **Toon Boom Harmony Essentials:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Essentials\1400-layouts.xml

Mac OS X

On Mac OS X, the Library folder is a hidden folder. To display the display the folder, told down the Alt key.

- **Toon Boom Harmony Premium:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Harmony/1400-layouts.xml
- **Toon Boom Harmony Advanced:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Advanced/1400-layouts.xml
- **Toon Boom Harmony Essentials:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Essentials/1400-layouts.xml

Linux

- /home/[user_name]/Toon Boom Animation/Toon Boom Harmony/1400-layouts.xml/
- /home/[user_name]/Toon Boom Animation/Toon Boom StageAdvanced/1400-layouts.xml/

When working with Harmony Server, your custom workspaces are stored in:

- **User:** [Server_Name] > USA_DB > users > [user_name] > stage > 1400-layouts.xml

Loading Workspaces

T-HFND-003-015

You can load an existing workspace from the drop-down menu.

How to load a workspace

1. Do one of the following:
 - Select **Windows > Workspace > Workspace**.
 - Select a workspace from the Workspace toolbar.

Creating Workspaces

T-HFND-003-016

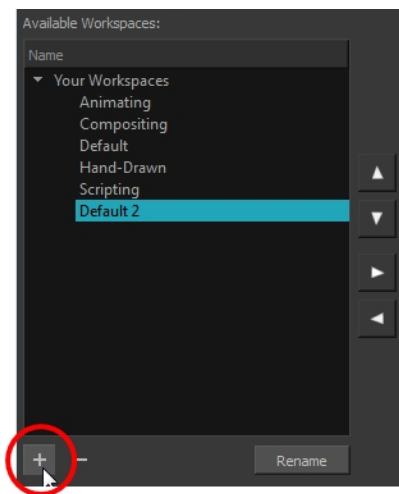

You can create new workspaces through the Workspace Manager dialog box.

How to create a new workspace

1. Do one of the following:
 - In the Workspace toolbar, click the  button.
 - From the top menu, select **Windows > Workspace > Workspace Manager**.
2. In the Available Workspaces list, select an existing workspace.

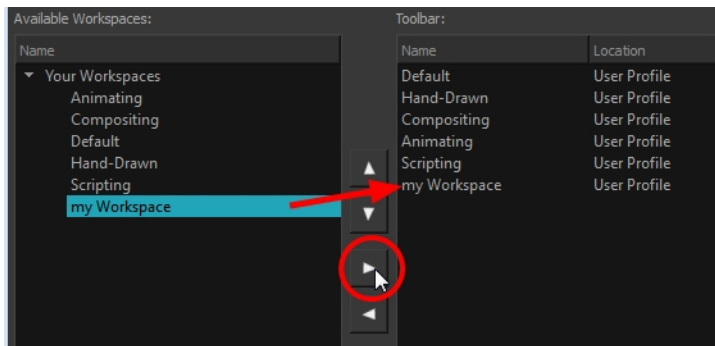

3. At the bottom of the Available Workspaces list, click the Add  button to add a workspace.

4. Select the new workspace that was created. Click **Rename** and give it a new name.

5. Select the new workspace and click the Right Arrow > button to move it to the Workspace toolbar.

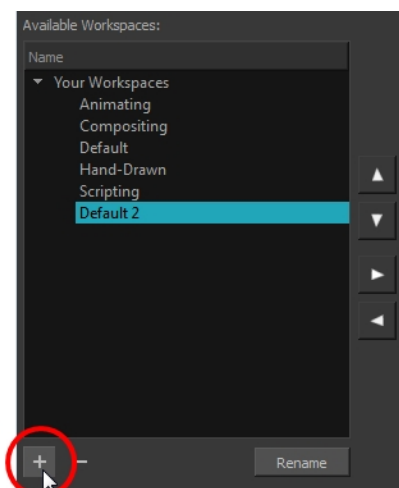

6. Click OK.

Renaming Workspaces

You can rename a workspace through the Workspace Manager dialog box.

How to rename a workspace

1. Do one of the following:
 - In the Workspace toolbar, click the  button.
 - From the top menu, select **Windows > Workspace > Workspace Manager**.
2. Choose the workspace to be renamed from the list.
3. Double-click on the workspace to be renamed or click the **Rename** button. This allows you to edit the name.

4. Type in the new name of the workspace.
5. Press the Enter/Return key to validate the name.
6. Click **OK**.

Saving Workspaces

T-HFND-003-017

You can either save your workspaces automatically or manually.

How to save your workspace as a new version

1. From the top menu, select **Windows > Workspace > Save Workspace As**.

The Save Workspace As dialog box opens.

2. Type in a workspace name and click **OK**.

How to disable the Automatically Save Workspace preference

1. From the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X) to open the Preferences dialog box.
2. Select the **General** tab.
3. In the Options section, deselect the **Automatically Save Workspace** option.
4. Click **OK**.

The Save Workspace  button appears in the Workspace toolbar.

How to save a workspace manually

1. Do one of the following:
 - In the Workspace toolbar, click the Save Workspace  button.
 - You can also select **Windows > Workspace > Save Workspace**.

Deleting Workspaces

You can delete a workspace through the Workspace Manager dialog box.

How to delete a workspace

1. Do one of the following:
 - In the Workspace toolbar, click the  button.
 - From the top menu, select **Windows > Workspace > Workspace Manager**.
2. In the Workspace Manager, select the workspace to be deleted and click the Left Arrow  button to move it to the Available Workspaces list.

3. Select the workspace from the Available Workspaces list, then click the Delete  button to delete the workspace.
4. Click **OK**.

Showing and Hiding Workspaces

You can show and hide workspaces from your drop-down list through the Workspace Manager dialog box.

How to show a workspace

1. Do one of the following:
 - In the Workspace toolbar, click the  button.
 - From the top menu, select **Windows > Workspace > Workspace Manager**.
2. In the Available Workspaces list, select the workspace to be displayed and click the Right Arrow  button to move it to the Workspace toolbar.
3. Click **OK**.

How to hide a workspace

1. Do one of the following:
 - In the Workspace toolbar, click the  button.
 - From the top menu, select **Windows > Workspace > Workspace Manager**.
2. In the Workspace Manager, select the workspace to be hidden and click the Left Arrow  button to move it to the Available Workspaces list.
3. Click **OK**.

Reordering Workspaces

You can reorder workspaces in your drop-down list through the Workspace Manager dialog box.

How to reorder workspaces

1. Do one of the following:
 - In the Workspace toolbar, click the  button.
 - From the top menu, select **Windows > Workspace > Workspace Manager**.
2. In the Workspace toolbar, select the workspace to be reordered and on the Up  or Down  buttons to move it up or down.

3. Click **OK**.

Restoring the Default Workspace

T-HFND-003-018

You can restore modified workspaces to their original layout.

How to restore the default workspaces

- Select **Windows > Restore Default Workspace**.

About Interface Navigation

Toon Boom Harmony lets you zoom in, zoom out, rotate, pan and reset views for easy navigation of the interface.

The navigation commands in the table below can be used in the following views, with some exceptions:

- Camera
- Drawing
- Perspective
- Timeline
- Xsheet
- Function
- Side and Top
- Model

Command	Action	Access Methods
Zoom In	Zooms in the view.	View > Zoom In Press 2 Roll the mouse wheel up (except in the Timeline and Xsheet views)
Zoom Out	Zooms out the view.	View > Zoom Out Press 1 Roll the mouse wheel down(except in the Timeline and Xsheet views)
Zoom In or Out	Zooms in or out of the view.	Roll the middle mouse button up or down. Hold down the Spacebar and the middle mouse button while dragging the mouse up or down.
Pan	Moves the view horizontally or vertically.	Hold down the Spacebar and drag in the direction you want to pan the view.
Reset Pan	Resets the view's pan to its default position.	View > Reset Pan Press Shift + N
Reset View	Resets the view to its default position.	View > Reset View Press Shift + M
Reset Rotation	Resets the view's rotation to its default position.	View > Reset Rotation Press Shift + X
Reset Zoom	Resets the view's zoom to its default position.	View > Reset Zoom
Rotate View	Rotates the view.	Press Ctrl+Alt (Windows/Linux) or Ctrl+⌘

		(Mac OS X) and drag in the direction you want to rotate the view.
Rotate 30 CW	Rotates the Camera view 30 degrees clockwise, like an animation table.	View > Rotate View CW
Rotate 30 CCW	Rotates the Camera view 30 degrees counter-clockwise, like an animation table.	View > Rotate View CCW
Toggle Quick Close-up	Instantly multiplies the view's Zoom Factor by 4. For example, if the Camera View's Zoom Factor is at 100%, this will make it toggle between 400% and 100%.	Shift+Z
Toggle Full Screen	<p>Cycles through the following display modes:</p> <ul style="list-style-type: none"> • Normal Full-Screen: The main application window becomes full screen. • View Full-Screen: The selected view becomes full screen and all other views are collapsed. • Normal: The main application window is restored to its original size and collapsed views are expanded. 	<p>View > Toggle Full Screen</p> <p>Press Ctrl + F (Windows/Linux) or ⌘ + F (Mac OS X)</p>

Using the Play Menu to Navigate

From the top menu, you can select any of the following commands from the Play menu to navigate around the interface.

Command	Description
Start Frame	Lets you set the frame on which playback will start.
End Frame	Lets you set the frame on which playback will end.
First Frame	Jump to the first frame. You can also press <.
Previous Frame	Jumps to the frame before the frame currently selected in the Timeline view. You can also press the comma (,) key.
Next Frame	Jumps to the frame after the currently selected frame in the Timeline view. You can also press the period (.) key.
Last Frame	Jumps to the last frame. You can also press >.
Go to Frame	<p>Opens the Go to Frame window in which you can enter the number of the frame you want to display.</p> <p>You can also use the Go button, which you can add to the Timeline toolbar through the Toolbar Manager. Open the Go to Frame dialog box and enter the frame number to jump to.</p>
Enable Playback	Plays back your animation from the Top, Side, or Perspective views.

Chapter 4: Drawing

Harmony has a wide array of drawing tools and drawing features to allow flexible design, work methods and styles.

Depending on the type of layer you select, here are the drawing tools available:

Tool Name	Icon	Vector Layer	Bitmap Layer
Select		•	•
Cutter		•	•
Reposition All Drawings		•	
Contour Editor		•	
Pencil Editor		•	
Smooth Editor		•	
Perspective		•	
Envelope			
Edit Gradient/Texture		•	
Brush		•	•
Pencil		•	
Text	T	•	•
Eraser		•	•
Paint		•	•
Ink		•	
Paint Unpainted		•	•
Repaint		•	
Unpaint		•	•
Stroke		•	
Close Gap		•	
Line		•	•
Rectangle		•	•
Ellipse		•	•
Polyline		•	
Dropper		•	•

Each drawing tool has a series of options to customize its behaviour and drawing style.

The Tool Properties view displays the properties of the currently selected tool on the current layer you are working. If you are editing a vector layer, then all of the tools are available to you. If you are drawing on a bitmap layer, some tools are not available. When tools are not available, they are grayed out in the Tools toolbar.

About the Brush Tool

T-HFND-004-003

The Brush tool is pressure sensitive and lets you create a contour shape with a thick and thin line effect, as if it was created with a paint brush.

With the Brush tool, you can draw as vector or bitmap, depending on the type of drawing layer you are using.

If you draw with vector, you can enlarge your drawing and zoom into it without losing quality or resolution. You can also use the Contour Editor and Select tools to resize and modify lines.

If you draw with bitmap, you will not be able to scale your drawing beyond 100% of its resolution without encountering pixelization issues.

There are a variety of brush styles provided with Harmony, which you can use to create and save your own brush style. This lets you create brushes with precise sizes and parameters and save them so you can draw and design with them. Renaming a brush can make it easier to identify and access the brushes you use most frequently.

You can also create a dynamic brush for drawing with patterns created from your artwork. Create a new dynamic brush to copy a pattern you have drawn to reproduce it quickly. You can create dynamic brushes using a single or multiple patterns that automatically switch through the patterns as you draw.

NOTE: To learn more about the Brush tool options, see the Reference guide .

Drawing with the Brush Tool

T-HFND-004-003A

In the Camera or Drawing view, you can draw on any drawing layer type with the Brush tool.

NOTE: To learn more about the Brush tool options, see the Reference guide .

How to draw with the Brush tool

1. In the Timeline or Xsheet view, select the cell on which you want to draw.
2. In the Tools toolbar, select the Brush  tool or press Alt + B.
3. In the Colour view, click a colour swatch to select a colour.

4. In the Drawing or Camera view, start drawing.
 - Hold Ctrl (Windows/Linux) or ⌘ (Mac OS X) to force a line to join the start and end of the shape while drawing.

Modifying the Brush Settings

You can modify several parameters such as the brush size and smoothing.

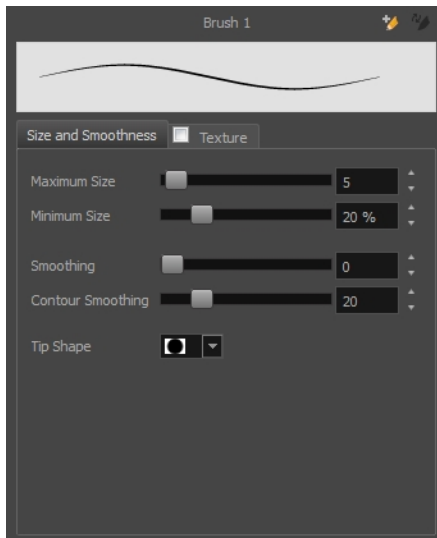

NOTE: If you are trying to create artwork on a bitmap drawing layer, and therefore with a bitmap brush, see [About Bitmap Brushes on page 145](#)

How to modify the brush settings

1. In the Tools toolbar, select the Brush  tool or press Alt + B.
2. In the Tool Properties view, the preview area displays the stroke that will be produced after you customize the different parameters. Click the arrow button.

The Brush Properties window opens.

Parameter	Description
Maximum Size	Defines the maximum size of your drawing tool. This parameter defines the width of the stroke.
Minimum Size	Defines the minimum size of your stroke as a percentage of the maximum size. If you do not have pressure sensitivity from a pen table, the minimum size value will be ignored.
Smoothing	Defines the number of control points added to the centre line. The fewer the control points the smoother (but less faithful) the line.

Contour Smoothness	Optimizes the contour line smoothness of the line. This parameter smooths the contour of the line once it has been traced. The higher the value, the fewer control points will compose your line.
Tip Shape	Lets you select a tip shape—from round and square ones to star shaped. This option is disabled when using a textured brush. 

NOTE: To learn more about the Brush tool options, see the Reference guide .

Selecting a Brush Preset

Harmony provides you with default brush presets available in the Tool Properties view.

How to select a brush preset

1. In the Tools toolbar, select the Brush  tool or press Alt + B.
2. In the Tool Properties view, select a brush preset from the Presets section.

Creating a Brush Preset

You can create your own custom brush presets and add them to the existing list.

How to create a brush preset

1. Make sure your current brush has the settings you want in the preset you will create—see the Reference guide .
2. In the Tool Properties view, do one of the following:
 - Click the arrow button to display the Brush Properties window and click the New Brush 🛠️ button in the upper-right corner.

- Click the New Brush 🛠️ button.
 - From the Brush ☰ menu, select **New Brush Preset**.
3. In the New Preset window, type a name for your new brush preset.
The new brush is added to the end of the list of brush presets.

Creating Dynamic Brush Presets

You can create dynamic brush presets allowing you to stamp custom patterns. You can either repeat the same pattern or loop a pattern made of several drawings.

How to create a new dynamic brush

1. In the Tools toolbar, select a drawing tool.
2. In the Camera or Drawing view, draw the pattern you want to use as your dynamic brush stamp.

3. In the Tools toolbar, click the Select  tool and select the parts of the drawing you want to repeat.

4. In the Tools toolbar, select the Brush  tool or press Alt + B.
5. In the Tool Properties view, click the Add Dynamic Brush  button to add your selection as a new dynamic brush preset.
6. From the Brush  menu, select **Rename Brush**.
7. Type in a name for the new dynamic brush and click **OK**.
8. In the Camera or Drawing view, start drawing with your dynamic brush to quickly repeat a pattern.

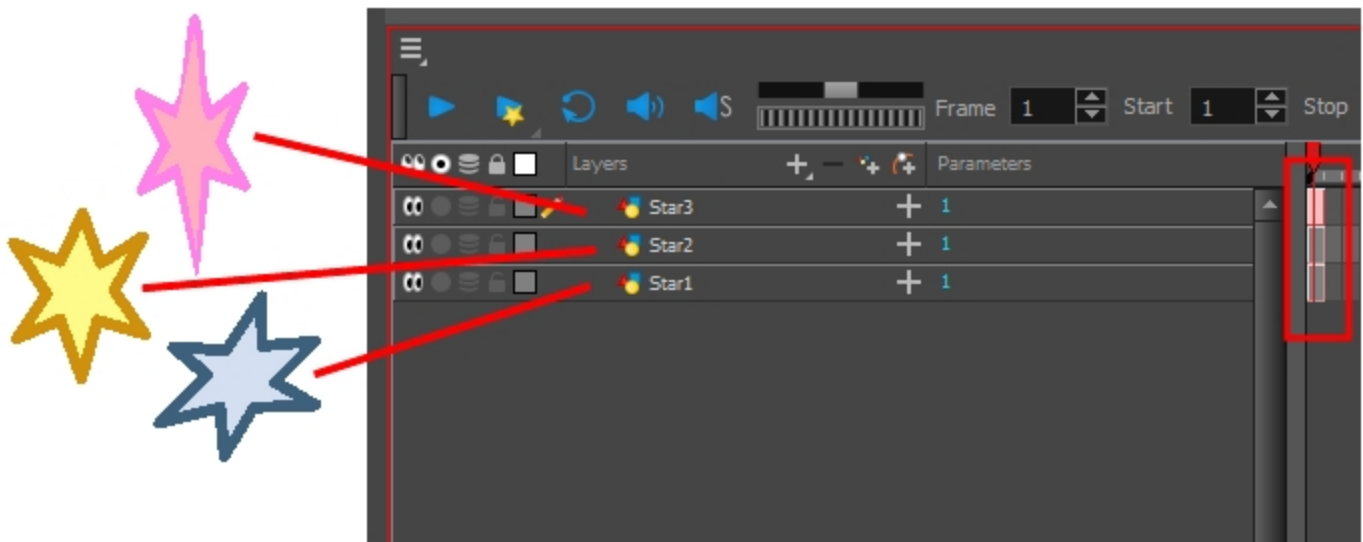

- To adjust the scale of your pattern to make it bigger or smaller as you stamp it, adjust the Maximum Size value in the Tool Properties view.

How to create a dynamic brush with multiple drawings

- In the Timeline view, click the Add Drawing Layers  button to create the layers you want to use as patterns in your dynamic brush. Make sure to rename your layers.

- In the Camera view, draw the individual drawings of your pattern on separate layers.

- In the Tools toolbar, select the Select  tool.
- In the Tool Properties view, disable the Works on Single Drawing  option to allow the Select tool to grab artwork on multiple layers.
- In the Camera view, select all the drawings you want to add to your new dynamic brush.

6. In the Tools toolbar, select the Brush  tool or press Alt + B.
7. Click the Add Dynamic Brush  button to add your selection as a new Dynamic Brush preset.
8. From the Brush menu, select **Rename Brush**.
The Rename Preset dialog box opens.
9. Type in a name for the new dynamic brush and click **OK**.
10. In the Camera or Drawing view, start drawing with your dynamic brush to quickly repeat a pattern. When you use this brush, you will cycle through the drawings.

Renaming a Brush Preset

To keep your list comprehensive and organized, you can name your custom brush presets.

How to rename a brush preset

1. In the Tool Properties view, select a brush to rename.
2. From the Brush  menu, select **Rename Brush**.
3. Type in a new name for the brush and click **OK**.

Deleting a Brush Preset

You can keep your preset list clean by deleting unwanted custom presets.

How to delete a brush preset

1. In the Tool Properties view, select the brush preset you want to delete.
2. Do one of the following:
 - Click the Delete Brush  button.
 - From the Brush  menu , select **Delete Brush**.

Updating a Brush Preset

If you want to modify the settings of an existing custom preset, you can do so by adjusting the parameters in the Tool Properties view and then update the preset.

How to update a brush preset

1. Select the brush preset to update and click the arrow button to display the Brush Properties window.

2. Change the brush settings and click the Update Brush Preset  button in the upper-right corner.

Exporting Brush Presets

You can export your presets to either backup, share, or install on a different computer.

How to export pencils, brushes and erasers

1. From the Brush menu, select **Export**.
2. In the Export Brushes dialog box, select the bitmap and vector brushes and erasers to export, as well as any pencils.

3. Click **Export**.
4. In the Export Brushes window that appears, browse to the location where you want to save the .xml file and give it a name.
5. Click **Save**.

Importing Brush Presets

You can import Harmony brush presets that you previously exported.

How to import pencils, brushes and erasers

1. From the Brush menu , select **Import Brushes**.
2. In the browser window that appears, navigate to and select the **.xml** file.
3. Click **Open**.
4. In the Import Brushes dialog box, select the brushes brushes and erasers you want to import. You can also import pencils at the same time.

5. Click **Import**.

The imported brush, eraser and pencil styles will appear in the presets library. You can reuse any of the imported tips to create other brush, eraser and pencil style presets.

Changing the Brush Preset Display

You can display your preset list as thumbnails or a list.

How to change the Presets Library thumbnail display

1. From the Brush menu, select one of the following:

Parameter	Description
Small Thumbnail	Reduces the size of the thumbnails in order to view more at the same time. Displays an image of the tool's tip and its maximum size.
Large Thumbnail	Increases the size of the thumbnails in order to see the images more clearly. Displays an image of the tool's tip, its maximum size and its name.
Stroke View	Displays the tool's name, maximum size and stroke preview.

About Vector Textured Brushes

In Harmony, you can use the Brush  tool to draw with bitmap textured brushes on vector layers. Those brushes are a mix of vector contours with bitmap texture fills.

In the Brush Tool Properties view, you will find a series of default textured "brushes", but you can also create and import your own custom collection. In Harmony, when using a textured brush on a vector layer, the texture of a brush is referred to as the *Paper Texture*. In other words, we are attributing the texture not to the tool, but to the texture of the surface that is revealed when a stroke passes over it. You will understand why when you work with bitmap brushes on bitmap layers, where it is possible to have both a textured brush tip and a paper texture.

To create your own textured brush, you must prepare your texture file ahead of time, either in Harmony or in a third-party software, such as Adobe Photoshop. Colour is not supported and transparency is not supported in the traditional sense. Black appears as 100% opaque, white appears as 100% transparent, and all the shades of grey in between appear as varying degrees of semitransparency. A range of file formats are supported— .jpeg, .png, .tif, .psd, .tga to name a few. Alpha channels are disregarded on import. It is recommended that you maintain the texture resolution between 100 x 100 pixels and 400 x 400 pixels.

You can import your custom paper textures in the extended Brush Properties window. Browsing for a texture file with a brush selected that is already using a paper texture will replace the file currently in use. It will not, however, replace the texture in lines already drawn. The replaced texture swatch will no longer be the selected texture, but it will remain in the texture library and not be deleted.

Harmony also allows you to import textures as an .xml file that was exported from another project. In this way, you do not have to import individual image files one-by-one to have the same texture library and brush presets as others

who you are collaborating with. You can also export brush presets and textures, in order to share your default or customized textures and presets with other project collaborators.

When you use the Eraser tool to erase a portion of a textured line, the vector frame is cut straight and you lose the feather created while drawing with the Brush tool. In Harmony, a special option in the Eraser Tool Properties lets you create a soft edge on your textured lines. You can also cut or keep the vector frame as is.

At some point, you may want to modify the look of a textured drawing if you suddenly find that your lines look too hard or too light. You can adjust those parameters by using the Adjust Line Texture Opacity command.

To draw with textured lines, use the Brush tool and the correct brush in the list. You can also draw with pencil line texture—see [About Pencil Line Texture on page 185](#)

Drawing with Vector Textured Brushes

Delete this text and replace it with your own content.

How to draw with textured lines

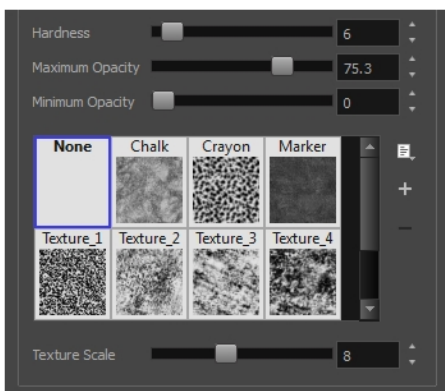

1. In the Tools toolbar, select the Brush  tool or press Alt + B.
2. Select a texture for your brush from the textures presets available at the end of the list.

3. If you want to modify the settings, in the Tool Properties view, click the Arrow button to open the Brush Properties view.

4. Click the Texture tab, select the **Paper Texture** option.

5. Set the following parameters:

Parameter	Description
Hardness	The hardness value corresponds to the softness of the line edge.

	<p>The lower the value, the softer the line edge will be. The higher the value, the sharper the line edge will be.</p> 
<p>Maximum Opacity</p>	<p>This value corresponds to the transparency of the stroke when the pressure is heavy.</p>
<p>Minimum Opacity</p>	<p>This value corresponds to the transparency of the stroke when the pressure is light and is a percentage of the Maximum Opacity value.</p> 

- In the Camera or Drawing view, start drawing.

Adding a Paper Texture

You can add custom paper textures to your presets.

How to add a paper texture

1. Do one of the following:
 - From the Paper Texture menu , select **Add**.
 - Click the Add Paper Texture button.

2. In the browser window that appears, navigate to where you saved your texture file.
3. Click **Open** to import the file into the Paper Texture library.

By default, an imported texture is given the name of the image file.

Renaming a Paper Texture

You can rename your paper textures to keep your list organized.

How to rename a paper texture

1. In the Paper Texture library, select a texture.
2. From the Paper Texture menu, select **Rename**.

3. In the Rename Texture dialog box that appears, type in the new name for the texture.

4. Click **OK**.

Deleting Paper Textures

You can delete unnecessary paper textures from your preset list.

How to delete a paper texture

1. In the Paper Texture library, select a texture.
2. Do one of the following:
 - In the Paper Texture menu, select **Delete**.
 - Click the Delete **–** button.

NOTE: You can delete any texture in the texture library as long as there is no brush preset using it.

Erasing Textured Lines

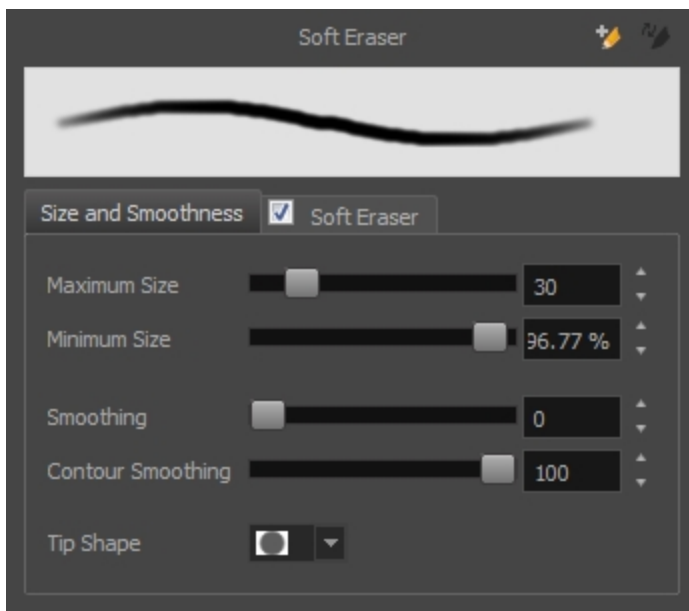

You can erase vector textures lines with a smooth eraser edge.

How to erase textured lines

1. In the Tools toolbar, select the Eraser  tool, press Alt + E.
2. In the Tool Properties view, click the arrow button.

The Eraser Properties window opens.

3. Adjust the following:

Hardness	Defines the softness of the stroke edge. The lower the value, the softer the stroke edge will be. The higher the value, the sharper the stroke edge will be.
Saturation	Lets you adjust the softness of edge feathering. Works in conjunction with the Hardness, e.g. 100% Hardness will yield no results in saturation change. 0% Hardness will allow a fine tuning of the feathering of the soft stroke edge.
Maximum Opacity	The transparency of the brush when the pressure is heavy. A smaller value will leave semi-transparent colour and texture. A larger value will ensure that everything is properly erased. This option is unavailable if the Keep Vectors option is disabled.
Minimum Opacity	Sets the minimum transparency of the brush, in relation to the Maximum Opacity, when the pressure is very light. A smaller value will

	leave semi-transparent colour and texture. A larger value will ensure that everything is properly erased. This option is unavailable if the Keep Vectors option is disabled.
Keep Vectors	Keeps the vector frames around your strokes intact, only the texture fill disappears. Disabling this option will cut the stroke's vector frame into different pieces when the Eraser tool passes over it. If you disable this option, the maximum and minimum opacity sliders are disabled as well.

4. In the Camera or Drawing view, erase your textures lines.

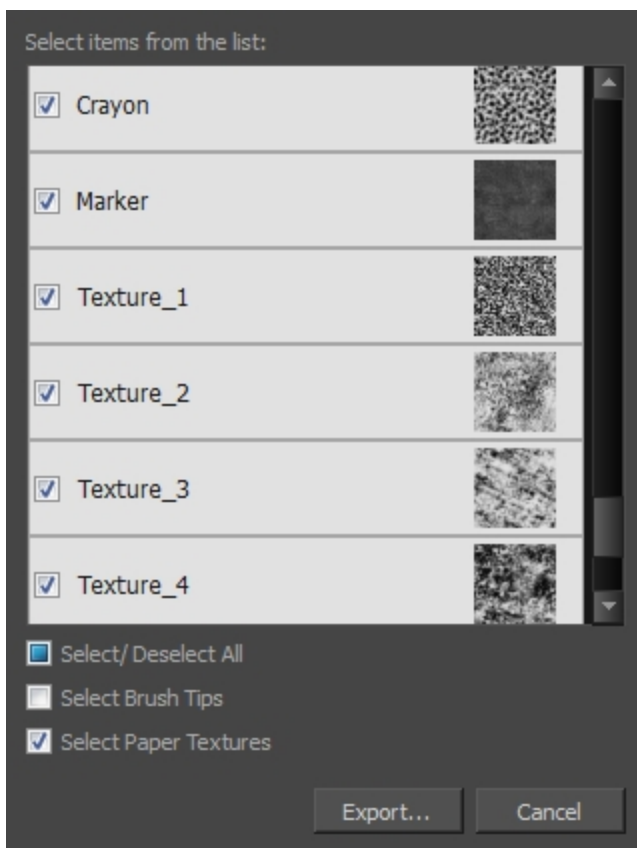

Exporting Paper Textures

You can export paper textures for either backup, sharing, or installing on a different computer.

How to export paper textures

1. In the Paper Texture menu, select **Export**.
2. In the Export Tips and Textures window, scroll down the textures list to the paper textures and select or deselect any textures to create the list that you wish to export. You can export brush tips at the same time too.

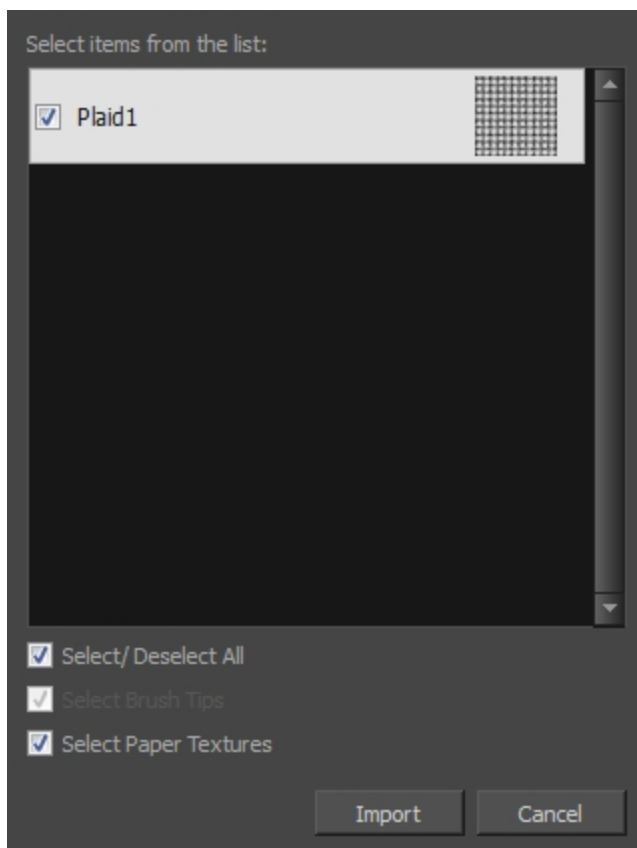

3. Click on the **Export** button.
4. In the Export Textures window that appears, browse to a location where you would like to save the .xml file and give it a name.
5. Click **Save**.

Importing Paper Textures

You can import paper texture presets you previously exported from Harmony.

How to import paper textures

1. In the Paper Texture menu, select **Import**.
2. In the browser window that appears, navigate to and select the **.xml** file.
3. Click **Open**.
4. In the Import Textures dialog box, select the paper textures that you wish to import. You can import any available brush tips at the same time too.

5. Click **Import**.

The imported paper textures will appear in the Paper Texture Library. You can reuse any of the imported paper textures to create other brush style presets.

Adjusting the Line Texture Opacity

If you drew with textured lines that are either too light or too dark, you can adjust the line texture opacity of your drawings.

How to adjust the line texture opacity

1. If you are in Camera view, select the **Current Drawing on Top** option—see [Displaying the Current Drawing on Top on page 281](#).
2. In the Timeline or Xsheet view, select the drawing that contains the opacity you want to adjust.
3. In the Camera or Drawing view menu, select **Drawing > Adjust Line Texture Opacity**.

The Adjust Line Texture Opacity dialog box opens.

4. Drag the sliders toward the middle to increase the contrast and opacity of the textured lines.
5. If you want to apply the changes to all drawings exposed on the layer, select the **Apply to All Drawings** option and click **OK**.

Changing the Paper Texture Display

You can change the display of the paper texture presets to thumbnails or a list.

How to change the Paper Texture thumbnail display

1. From the Paper Texture menu, select one of the following:

Parameter	Description
Small Thumbnail	Reduces the size of the thumbnails in order to view more at the same time.
Large Thumbnail	Increases the size of the thumbnails in order to see the images more clearly.
List View	Allows you to see the name, as well as the thumbnail.

About Bitmap Brushes

With Harmony, you have the choice to draw with vector or bitmap brushes. This is decided by what modes you select for your layer. When adding a new drawing layer in Harmony, you can set your art layers (Line Art, Colour Art) to vector or bitmap. This way, you can draw in bitmap and paint in vector, draw everything in bitmap, or any other combination that suits your needs. If you are using the Overlay and Underlay layers, you can also set them to bitmap or vector.

When drawing on a bitmap layer, these are the tools available:

- Brush
- Cutter
- Dropper
- Edit Gradient/Texture
- Ellipse
- Eraser
- Line
- Paint
- Paint Unpainted
- Pivot
- Rectangle
- Repaint
- Reposition All Drawings
- Select
- Text
- Unpaint

On a bitmap layer, a temporary vector layer is created when painting with a gradient. Until a modification is made on your layer with a bitmap drawing tool, you can edit your last painted zone, by editing the gradient swatch, which is dynamically linked to the painted zone or using the Edit Gradient texture tool. When a bitmap drawing tool or action is used, a vector-to-bitmap conversion occurs. If there are vector elements on the layer (such as if you switched your art mode from vector to bitmap after having created vector artwork), they too will be converted to bitmap.

Here is a list of tools and actions that will trigger a vector-to-bitmap conversion:

- Brush
- Ellipse
- Eraser
- Line
- Paint
- Paint Unpainted
- Rectangle
- Repaint
- Unpaint
- Performing a paste with the Select tool selected
- Performing a paste with the Cutter tool selected

This means that certain tools, such as the Text or Cutter tool, will not trigger a conversion.

If you selected the incorrect art modes for your layer, you can open the Layer Properties view and change them. If you switch the art mode for a layer that already has strokes on it, the artwork will NOT be converted for bitmap artwork, but will be for vector artwork, though not immediately. A drawing with bitmap strokes on a newly converted vector layer will remain bitmap. This means that the bitmap artwork will not be editable by some tools, such as the Eraser tool, but will be editable by other tools, such as the Cutter tool. However, a drawing with vector lines on a newly converted bitmap layer will remain vector temporarily, until a bitmap drawing tool or action is used. Then the vector-to-bitmap conversion will occur.

To always reuse the same art mode settings, you can adjust them in the Preferences dialog box.

If you want to be able to edit the artwork in the new mode, you need to convert the drawings.

Vector-to-bitmap conversion includes flattening individual drawings into a single image. Flattening means that it will not be possible to select non-overlapping or overlapping elements as individual objects with the Select tool. Instead, the selection of one drawing will initiate the selection of all elements, with a single vector frame surrounding them.

Resampling is also triggered on bitmap layers with the use of a bitmap drawing tool. For example, if you draw the outline of a circle, scale it down and then zoom into it, you will see tiny square pixels along the edge of the line. If you then draw a line right next to it, you will notice two things: first that the square pixels of the new line are gigantic by comparison and that the pixels in the line of your circle suddenly become the same size. This is because the circle was resampled. It was not resampled when you scaled it down. It was resampled when you used a bitmap drawing tool. It is resampled so that all the drawn objects are scaled to the same bitmap grid, in other words that their basic unit, the pixel, is the same size. The grid is defined by the bitmap layer's resolution.

Before you start drawing in bitmap, it is important to understand that your artwork will now be resolution dependent. If you zoom in your scene, your artwork will be enlarged. It is important to plan ahead and decide how high of a resolution you need your artwork to be. If you plan to zoom in your scene, the smallest section of the image that the camera will frame must be 100% the size of your scene resolution. For example, if your scene resolution is set to 1920 x 1080 and you zoom in 300% with your camera, then the resolution of the bitmap layer also has to be set to 300%, otherwise its elements will look pixelated in the final render. It is important to change the bitmap layer resolution before you start drawing.

$$5760 / 1920 \times 100 = 300\%$$

The bitmap resolution can be set at the scene level or drawing level. The setting at the scene level affects newly created bitmap art layers.

Note that even if your drawing resolution is set to be very large, it doesn't mean that your file will be very heavy. It depends on the amount of artwork you draw in it.

The yellow tiles are the spaces containing artwork. The white tiles are empty spaces, making the bitmap image much lighter.

The bitmap resolution (width and height) is the resolution of the tiles in relation to the project resolution.

There is a function to Lets you change the resolution of bitmap art for individual drawings. You can reduce the resolution of your bitmap file as well as increase it. Be careful because enlarging the bitmap resolution on an existing drawing will result in a loss of quality. Harmony will perform a pixel smoothing pass (resampling) and create additional pixels to avoid losing too much quality, but only to a certain extent. This feature is very useful when you need to have a full resolution of a bitmap image (such as imported bitmaps as .psd or .tga for the background) for tracing to create a matte directly in Harmony. By default, Harmony creates small thumbnail images when imported as bitmap in order to increase performance by using a small thumbnail image instead of using the original large size bitmap for animation work in Harmony. This will make difficult to view details or trace due to the low resolution (blurry). This option temporary increases the resolution of bitmaps up to their original bitmap resolution to make tracing easier.

For example, what if you used the default scene's resolution for some bitmap art, but then discover you are zooming-in quite close? If you do not want to see the pixels appear too much when you are zoomed in, you can set the bitmap resolution to 200% and the bitmap art will have a higher resolution with smaller pixels, but will NOT retain 100% of its quality. You can use this function on multiple drawings using the Apply to All Drawings option. Changing this option will affect existing and selected bitmap art layers.

If you draw an outline on a bitmap layer, you can still vectorize it. Using a vector drawing layer, simply select your bitmap drawing and the vector cell of where you want your vectorized line to be, and use the Vectorize Line Art in Selected Drawing function.

You should avoid scaling up your bitmap strokes using the Select tool. If you do, keep in mind that when you continue drawing, your image will be resampled and your new strokes will be scaled to the scene resolution.

Scaled-up bitmap drawing before reesampling

Scaled-up bitmap drawing resampled. The new brush stroke triggers the resampling.

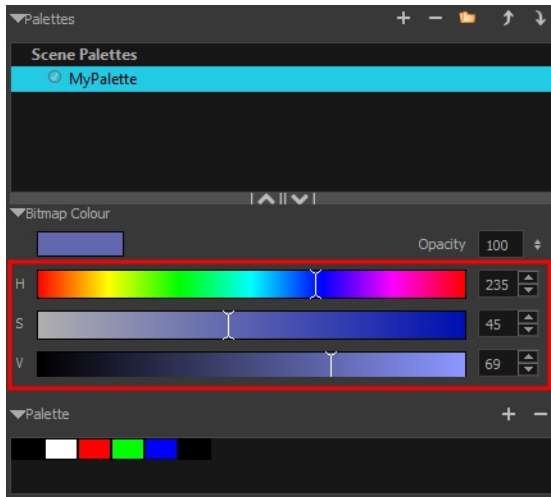

NOTE: Your drawing should be scaled up using the Transform  tool when animating, instead of the Select tool, in order to avoid creating very large bitmap layers. Harmony calculates the scaling of your drawings when you use the Transform tool; your image is mathematically transformed. When you use the Select tool to scale, you are physically scaling the drawing.

Drawing with Bitmap Brushes

You can use the Brush tool to draw on bitmap layers.

How to draw with bitmap brushes

1. In the Timeline view, add a bitmap drawing layer—see [Drawing with Bitmap Brushes on page 150](#).
2. In the Tools toolbar, select the Brush  tool or press Alt + B.
3. In the Colour view, select a colour.

- To switch the bitmap colour picker from HSV to RGB, in the Colour view menu, select **Colour > Bitmap Colour Sliders > HSV Sliders** or **RGB Sliders**. You can also right-click on the colour sliders and select **RGB Sliders** or **HSV Sliders**.

When using bitmap colours, there is no longer a link between the painted zones and selected colour. You can edit the colour as much as you want, but your drawing will not be affected. You can still select colours from your vector colour palette to use the same tint, but you will not create links between your drawing and the swatches.

4. In the Camera or Drawing view, start drawing.

Creating Bitmap Brushes

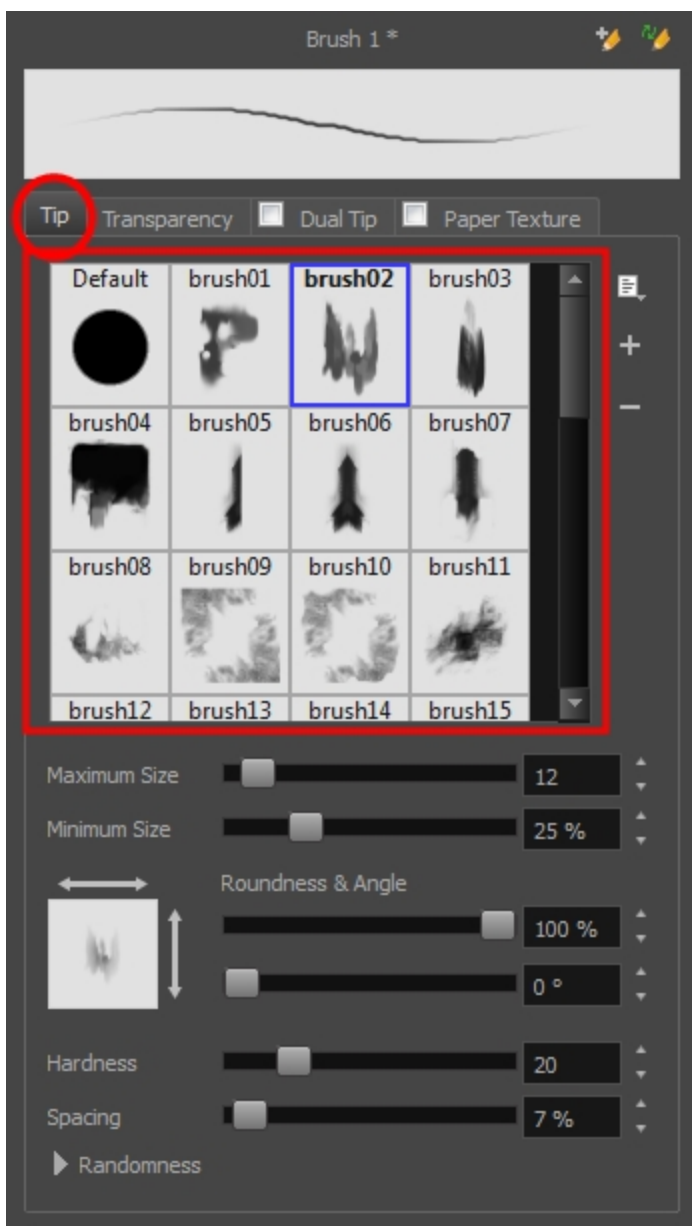

With bitmap brushes in Harmony, you can create an infinite range of fuzzy, textured and watercolour lines. You can combine two different brush tips, with separate sets of parameters, with the Dual Tip feature. You can also select a paper texture that will mimic the texture of the surface that is being painted on. Uses these features separately or in combination to create distinct, natural-looking strokes.

How to create a bitmap brush preset

1. In the Timeline view, create a new Bitmap drawing layer.
2. In the Tools toolbar, select the Brush  tool or press Alt + B.
3. In the Tool Properties view, select a brush and click the Arrow button to open the Bitmap Brush Properties view.

4. In the Tip tab, select a brush tip.

5. Click on the different tabs to access the options available for adjustment. You can use the brush stroke preview at the top to view all your adjustments in real time.
- **Tip tab:** Make adjustments to size, brush tip angle, hardness and spacing.
 - **Transparency tab:** Make adjustments to flow and opacity.
 - **Dual Tip tab:** Select this option to enable the Dual Tip feature. Select a dual brush tip and make adjustments to its size, brush tip angle, hardness and spacing.
 - **Paper Texture tab:** Select this option to enable the Paper Texture feature. Select a paper texture and make adjustments to its scale, alignment and additivity. To learn more about using paper textures, see:

- [Adding a Paper Texture](#) on page 136
 - [Renaming a Paper Texture](#) on page 137
 - [Deleting Paper Textures](#)
 - [Exporting Paper Textures](#)
 - [Importing Paper Textures](#)
 - [Changing the Paper Texture Display](#) on page 144
6. When you are satisfied with the look of your bitmap brush, click the Add New Brush Preset  button at the top-right corner of the Bitmap Brush Properties window.
 7. In the New Preset dialog box that appears, enter the name for your brush preset.

8. Click **OK**.

If you continue to make adjustments to your new brush preset and want to save these changes, click the Update Preset  button. Otherwise, your modifications will only be saved until another brush preset or drawing tool is selected.

How to add a brush tip

1. Do one of the following:
 - From the Brush Tip menu, select **Add**.
 - Click the Add  button.
2. In the browser window that appears, navigate to where you saved your file.
3. Click **Open** to import the file into the Brush Tip Library.

By default, an imported brush tip is given the name of the image file.

Renaming Brush Tips

You can rename your bitmap brush tips to keep your list organized.

How to rename a brush tip

1. In the Brush Tip Library, select a brush tip.
2. From the Brush Tip menu, select **Rename**.
3. In the Rename dialog box that appears, type in the new name of the brush tip.
4. Click **OK**.

Deleting Brush Tips

You can delete unnecessary brush tips to keep your list organized.

How to delete a brush tip

1. In the Brush Tip Library, select a brush tip.
2. Do one of the following:

- ▶ In the Brush Tip menu, select **Delete**.
- ▶ Click the Delete  button.

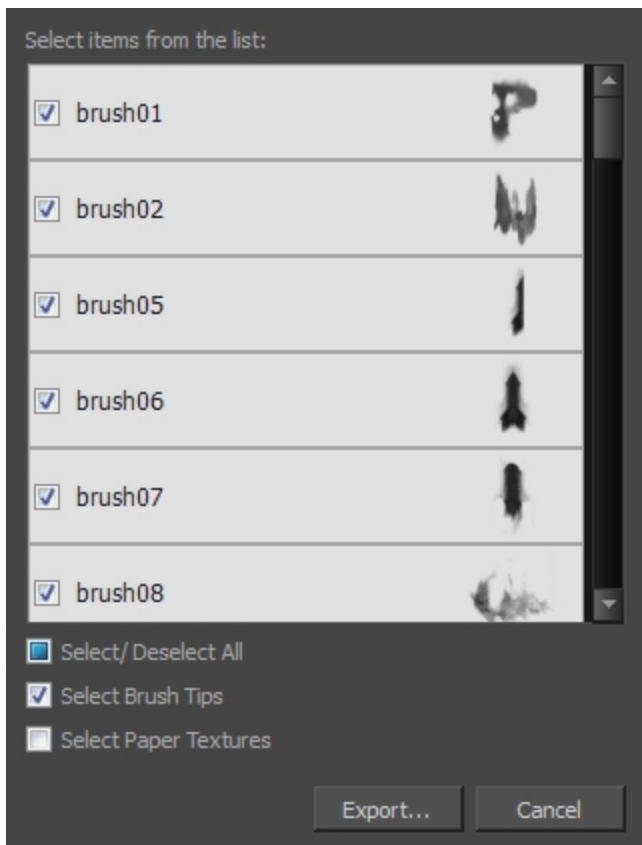

The linked brush tip file does not get deleted and can therefore be reimported.

Exporting Brush Tips

You can export brush tips to share, backup or install on a new computer.

How to export brush tips

1. In the Brush Tip menu, select **Export**.
2. In the Export Tips and Textures window, select or deselect any of the brush tips to create the list to export. You can also export paper textures at the same time.

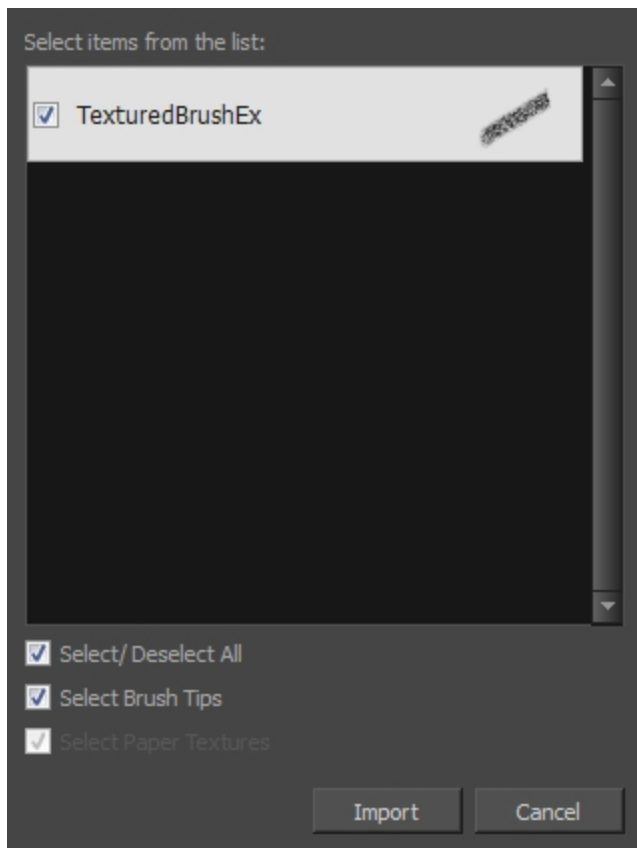

3. Click **Export**.
4. In the Export Textures window that appears, browse to a location where you want save the **.xml** file and give it a name.
5. Click **Save**.

Importing Brush Tips

You can import Harmony brush tips you previously exported.

How to import brush tips

1. In the Brush Tip menu, select **Import**.
2. In the browser window that appears, navigate to and select the **.xml** file.
3. Click **Open**.
4. In the Import Textures dialog box, select the brush tips to import. You can also import paper textures at the same time.

5. Click **Import**.

The imported brush tips appear in the Brush Tips Library. You can reuse any of the imported tips to create other brush style presets.

Changing the Brush Tip Display

You can display your preset list as thumbnails or a list.

How to change the Brush Tips thumbnail display

1. From Brush Tip menu, select one of the following options:

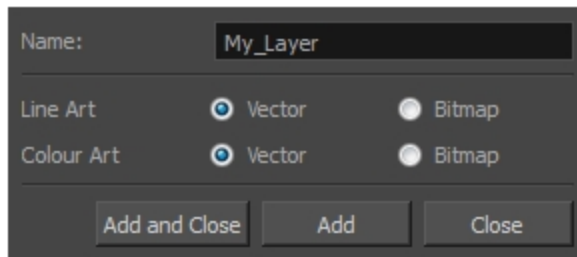

Parameter	Description
Small Thumbnail	Reduces the size of the thumbnails in order to view more at the same time.
Large Thumbnail	Increases the size of the thumbnails in order to see the images more clearly.
List View	Allows you to see the name, as well as the thumbnail.

Adding Bitmap Layers

When adding a layer, you must set your art layer parameters to bitmap in order to use bitmap layers.

How to add a bitmap layer

1. In the Timeline view, click the Add Drawing Layer  button,
The Add Drawing Layer window opens.

If you are using the Overlay and Underlay layers, those art layers are also displayed.

2. For each art layer, select the **Vector** or **Bitmap** option.

3. Click **OK**.

Changing Art Modes

Once a layer is created, you can change the individual art layers to be either bitmap or vector. If some artwork is already contained on the art layers, it will not be fully converted—see [About Bitmap Brushes on page 145](#),

How to change the art mode

1. Open the Layer Properties view.
2. In the Timeline view, select the layer you want to edit.
3. In the Layer Properties view, select the **Drawing** tab.

4. In the Art Layers section, select the art mode for each art layer.

Converting Artwork

You can convert the artwork on an art layer to match its new layer type. You can also vectorize your bitmap artwork to work in a vector layer.

How to convert drawings to match the art mode

1. In the Timeline view, select the layer that contains the drawings you want to convert.
2. From the Timeline view menu, select **Layers > Convert Drawings to Match Art Layer Type**.

You can also right-click on the selected layer and select **Convert Drawings to Match Art Layer Type**.

All drawings in the layer are converted to the selected art mode. Note that bitmap strokes are not vectorized when converted to a vector art layer. They are simply inserted in a square vector frame containing a bitmap texture.

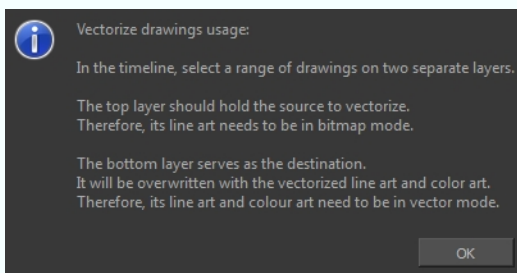

How to vectorize a bitmap drawing

1. In the Timeline view, add a vector drawing layer BELOW the bitmap drawing layer containing the drawing to vectorize. In your bitmap drawing, the artwork to vectorize must be placed on the Line Art layer (default drawing layer).

NOTE:

If you place the vector drawing on top of the bitmap layer, you will not be able to perform the operation. A warning dialog box will display.

2. On the right side of the Timeline view, select the bitmap drawing and corresponding cell in the vector drawing layer.

3. Right-click and select **Drawings > Vectorize Line Art in Selected Drawing**.

The Convert to Vector Drawing dialog box opens.

4. In the Vectorization section, select a vectorization preset. You can customize your own preset using the Add or Edit buttons.
5. Click **OK**.

Your vectorized drawing is created in the vector drawing layer. Your bitmap drawing remains intact.

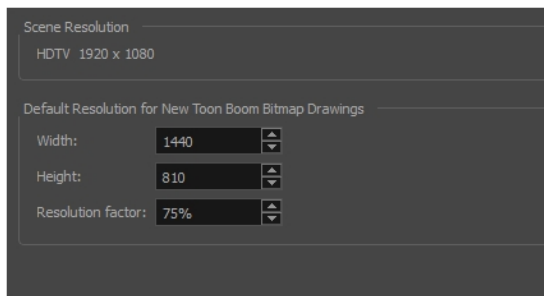

Changing the Bitmap Resolution

You can change the bitmap drawing resolution at the scene or the drawing level—see [About Bitmap Brushes on page 145](#).

How to change the bitmap layer resolution at the scene level

1. From the top menu, select **Scene > Scene Settings**.
The Scene Settings dialog box opens.
2. Select the **Bitmap Resolution** tab.
3. Change the bitmap resolution settings and click **OK**.

The bitmap resolution settings at the scene level affects newly created bitmap art layers.

The yellow tiles are the spaces containing artwork. The white tiles are empty spaces, making the bitmap image much lighter.

The bitmap resolution (width and height) is the resolution of the tiles in relation to the project resolution.

Parameter	Description
Scene Resolution	This is the scene resolution preset name and size in pixels.
Width	This is the width of the resolution for the bitmap that will be created. This is not the actual size of the bitmap. TVG drawings (Toon Boom drawing native format) have an infinite size. Bitmap TVGs are composed of small tiles. Therefore it does not mean that because you have artwork at the four corners of your camera frame or even quite far outside of your drawing that your bitmap image will be very large and heavy. By default, it is set to the same width as the scene resolution.
Height	This is the height of the resolution for the bitmap that will be created. By default, it is set to the same height as the scene resolution.
Resolution Factor	This is the size of the bitmap resolution in relation to the scene resolution. If

you increase the percentage, the width and height fields will increase accordingly. If you plan to animate the camera and zoom into your background, you will need to set a higher resolution so that the smaller area in which you will zoom will be 100% of the scene resolution.

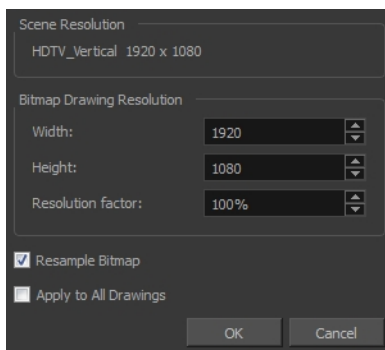

How to change the bitmap resolution at the drawing level

1. In the Timeline view, select the drawing whose resolution you want to change.

NOTE: Note that the drawing can be enlarged slightly and retain its original look, but you may lose quality if you enlarge it too much. Pixels are created and a smoothing pass is applied. You should set your resolution before drawing. If you need to change the resolution of a drawing to be larger than the one set in the Scene Settings dialog box, create an empty drawing first and then follow this procedure.

2. From the top menu, select **Drawing > Change Bitmap Drawing Resolution**.

The Change Bitmap Drawing Resolution window opens.

Parameter	Description
Scene Resolution	This is the scene resolution preset name and size in pixels.
Width	This is the width of the resolution for the bitmap that will be created. This is not the actual size of the bitmap. TVG drawings (Toon Boom drawing native format) have an infinite size. Bitmap TVGs are composed of small tiles. Therefore it does not mean that because you have artwork at the four corners of your camera frame or even quite far outside of your drawing that your bitmap image will be very large and heavy. By default, it is set to the same width as the scene resolution.
Height	This is the height of the resolution for the bitmap that will be created. By default, it is set to the same height as the scene resolution.
Resolution Factor	This is the size of the bitmap resolution in relation to the scene resolution. If you increase the percentage, the width and height fields will increase accordingly. If you plan to animate the camera and zoom into your background, you will need to set a higher resolution so that the smaller area in which you will zoom will be 100% of the scene resolution.
Resample Bitmap	When this option is selected, the existing bitmap image is modified to match the

	<p>new resolution. If the width and height are increased, more pixels will be created to enlarge the image. Visually, the existing artwork will look the same, maybe a little bit smoothed out, but the size will look the same. When this option is deselected, the artwork is not modified. Only the reference grid is resized. If the scene resolution is 1920 x 1080 and you reduce the bitmap resolution to 960 x 540, the image will be scaled up to twice the size of the scene.</p>
Apply to All Drawings	<p>The modified settings are applied to all drawings in the drawing layer for a given art layer. If the Apply to Line Art and Colour Art option is enabled, it will then be applied to all bitmap art layers.</p>

3. Change the bitmap resolution.
4. Click **OK**.

About the Pencil Tool

T-HFND-004-004

The Pencil tool is for drawing the final images, such as character nodes, cut-out puppet and clean animation. The pencil creates a central vector shape. Pencil lines support pressure sensitivity and texture.

The Brush and Pencil tools are used for drawing and sketching. Both tools support pressure sensitivity, allowing you to create lines with variable thickness. The Brush tool produces contour vector lines. The Pencil and shape tools produce central vector lines. This means that a pencil line's control points (used to deform its shape) are located along the length of the central spine, while the Brush line's control points are located along the contour.

- If you draw with the Brush tool and want to modify the thickness variation, use the Contour Editor tool.
- If you draw with the Pencil tool and want to modify the thickness variation, use the Pencil Editor tool.
- You can also convert a brush zone into a pencil line with the Brush Stroke to Pencil Line option.

If you sketch a drawing using a semitransparent colour to get a paper-like feel, you should use the Brush tool as it produces a more realistic and natural feel. The pencil line is very useful for tracing clean or final drawings.

Also, it is recommended to use brush lines when designing cut-out puppet articulations which use patches.

NOTE: To learn more about the Pencil tool options, see the Reference guide .

Drawing with the Pencil Tool

T-HFND-004-004A

Using the Pencil tool, you can draw central vector lines which easily reshapeable.

NOTE: To learn more about the Pencil tool options, see the Reference guide .

How to draw with the Pencil tool

1. In the Timeline or Xsheet view, select the cell on which you want to draw.
2. In the Tools toolbar, select the Pencil  tool or press Alt + /. .
3. In the Colour view, click a colour swatch to select a colour.

4. In the Drawing or Camera view, start drawing.

- When you get close to an existing pencil line, hold Alt to draw and connect your stroke to the existing one. Pencil lines are central vector lines and you might think your line is connected, but in fact, only the contour is touching the other one. Also, make sure the central vector crosses the other one.
To connect the start or end of your stroke, hold Alt when you start or finish drawing a line.
- To draw a straight line, press Shift + Alt as you draw.

Modifying the Pencil Settings

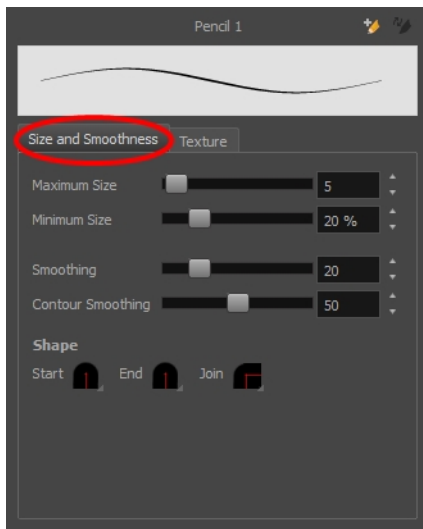

You can modify the Pencil tool settings such as the size, smoothing, and ends,

How to modify the pencil settings

1. In the Tools toolbar, select the Pencil  tool or press Alt + /.
2. In the Tool Properties view, the preview area displays the stroke that will be produced after you customize the different parameters in the Tool Properties view. Click the arrow button.

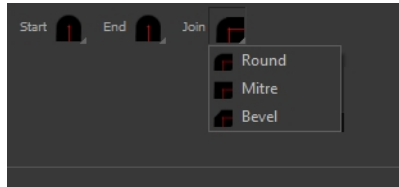

The Pencil Properties window opens.

This is where you set the minimum and maximum sizes of your drawing tool which will produce the thick and thin effect on your stroke. This works with the pressure sensitivity of a pen tablet.

Parameter	Description
Size and Smoothness tab	
Maximum Size	Sets the maximum width of the line.
Minimum Size	Sets the minimum width of the line in relation to the maximum size.
Smoothness	Lets you modify the central line smoothness of the line. This parameter smooths the initial movement of your line. Increasing the value will result in a smoother line with fewer control points.
Contour Smoothness	Optimizes the contour line smoothness of the line. This parameter will smooth the contour of the line once it has been traced; the higher the value, the fewer control points will compose your line.
Shape	<p>You can adjust the start, end, and joint style of a pencil line.</p>  <ul style="list-style-type: none"> • Start: Lets you select the style of the start tip, which is the first tip you drew. You can choose between Round or Flat style.

	<ul style="list-style-type: none">• End: Lets you select the style of the end tip, which is the last tip you drew. You can choose between Round or Flat style.• Join: Lets you select the joint style. The joints are where the line curves abruptly. You could also define the Join style as the corner style. You can choose between Round, Mitre and Bevel style.
Texture tab	
Texture	See About Pencil Line Texture on page 185.

Selecting a Pencil Preset

A pencil preset is a pencil with specific properties. You can work with regular pencil presets and thickness stencils.

How to select a pencil preset

1. In the Tools toolbar, select the Pencil , Line , Ellipse , or Rectangle  tool.
2. In the Tool Properties view, use the Presets menu to select a pencil preset.

3. In the Drawing or Camera view, draw your pencil line or shape.

Creating Pencil Presets

You can create your own custom pencil presets.

Regular pencil presets allow you to set the size and smoothing of the line or shape. As you draw, the thickness of the line varies according to the amount of pressure you apply with a pen and tablet.

NOTE: To learn more about the Pencil tool options, see the Reference guide .

How to create a pencil preset

1. In the Tools toolbar, select the Pencil  , Line  , Ellipse  , or Rectangle  tool.
2. In the Tool Properties view, adjust your pencil settings the Reference guide .
3. In the Tool Properties view, click the New Brush  button.

The New Preset dialog box opens.

4. Type in a name for your new pencil thickness stencil and click **OK**.
5. Start drawing in the Drawing or Camera view.

Creating Pencil Thickness Presets

Thickness stencils that are indicated with this  icon are also set with specific properties, but disregards the pressure of your pen and tablet. The line thickness varies. You can access thickness stencils from the list of presets on the Tool Properties view or create your own.

How to create a pencil thickness stencil

1. In the Tools toolbar, select the Select  tool.
2. In the Camera view, select the pencil line or shape from which you want to take the style.

3. In the Tool Properties view, click the New Thickness Stencil  button.
A new thickness stencil is added to the end of the list in the Presets menu.
4. In the Presets menu, select a new thickness stencil and click on a line or shape in the Drawing or Camera view to apply the thickness stencil you created.

Renaming Pencil Presets

You can rename your pencil presets to keep your list organized.

How to rename a pencil preset

1. In the Tools toolbar, select the Pencil , Line , Ellipse , or Rectangle  tool.
2. In the Presets menu, select the thickness stencil or preset you want to rename.
3. From the Brush menu , select **Rename Brush**.

The Rename Preset dialog box opens.

4. In the Name field, type in the new name.
5. Click **OK**.

Deleting Pencil Presets

You can delete unnecessary presets from your list.

How to delete a thickness stencil or pencil preset

1. In the Tools toolbar, select the Pencil  tool.
2. In the Presets menu, select the thickness stencil or preset to delete.
3. Click the Delete Preset  button.

Applying a Pencil Preset

You can apply a pencil preset on already drawn pencil lines using the Select tool.

How to apply a thickness stencil to a pencil line or shape

1. In the Tools toolbar, select the Select  tool.
2. In the Drawing or Camera view, select the pencil line or shape on which you want to apply a style.

3. In the Tool Properties view, select the style you want to apply from the Presets list.

The style you selected is applied to your selection.

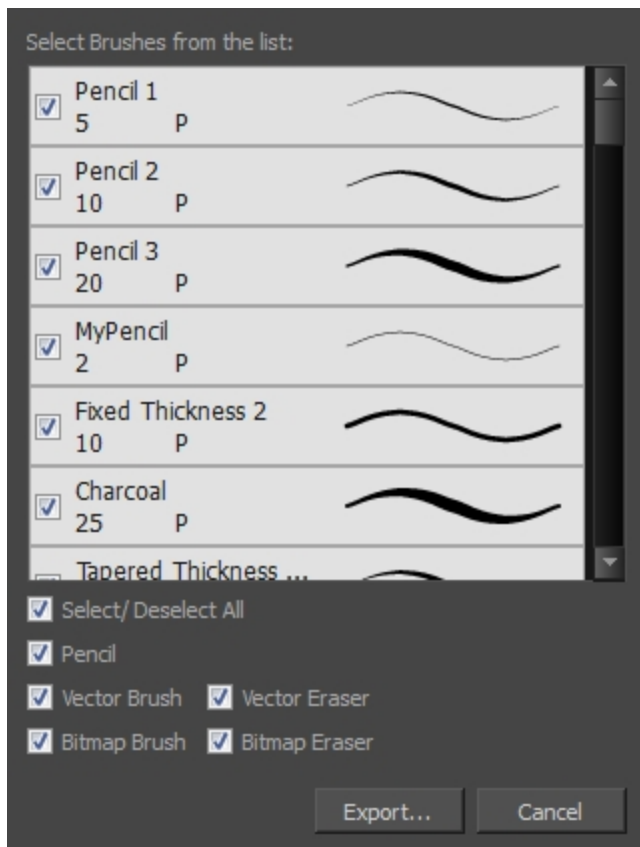

Exporting Pencil Presets

You can export your pencil presets to either backup, share or install on a different computer.

How to export pencils, brushes and erasers

1. From the Brush menu, select **Export**.
2. In the Export Brushes dialog box, select the bitmap and vector brushes and erasers to export, as well as any pencils.

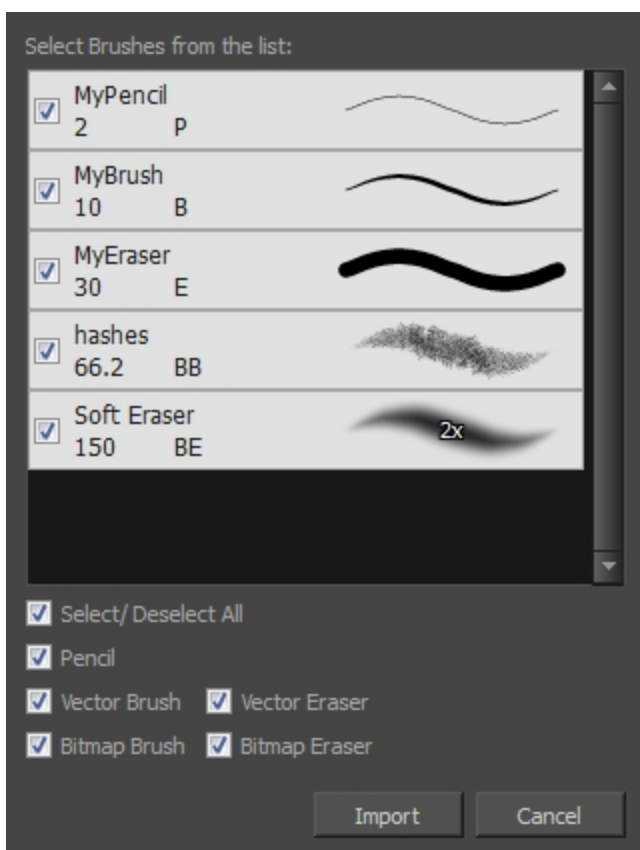

3. Click **Export**.
4. In the Export Brushes window that appears, browse to the location where you want to save the .xml file and give it a name.
5. Click **Save**.

Importing Pencil Presets

You can import Harmony pencil presets that you previously exported.

How to import pencils, brushes and erasers

1. From the Brush menu , select **Import Brushes**.
2. In the browser window that appears, navigate to and select the **.xml** file.
3. Click **Open**.
4. In the Import Brushes dialog box, select the brushes brushes and erasers you want to import. You can also import pencils at the same time.

5. Click **Import**.

The imported brush, eraser and pencil styles will appear in the presets library. You can reuse any of the imported tips to create other brush, eraser and pencil style presets.

Changing the Pencil Preset Display

You can display your preset list as thumbnails or a list.

How to change the Presets Library thumbnail display

1. From the Brush menu, select one of the following:

Parameter	Description
Small Thumbnail	Reduces the size of the thumbnails in order to view more at the same time. Displays an image of the tool's tip and its maximum size.
Large Thumbnail	Increases the size of the thumbnails in order to see the images more clearly. Displays an image of the tool's tip, its maximum size and its name.
Stroke View	Displays the tool's name, maximum size and stroke preview.

Changing Pencil Line Opacity Display

A central vector outline can obscure the true edges of a shape's fill. You can change the opacity of central vector lines and outlines, while working, to bypass this problem. This feature only works in the OpenGL view. This feature is meant to be used as a working tool, like the Light Table or Onion Skin, therefore this transparency effect will not appear when the scene is rendered. However, the opacity value that you set will remain as the set preference, even after you end a session and close the software.

If you want the transparency of a line or outline to show up in the render of your scene, use one of the many other options that Harmony offers, such as colouring the line with a semi-transparent swatch or using the Transparency or Colour-Override effects.

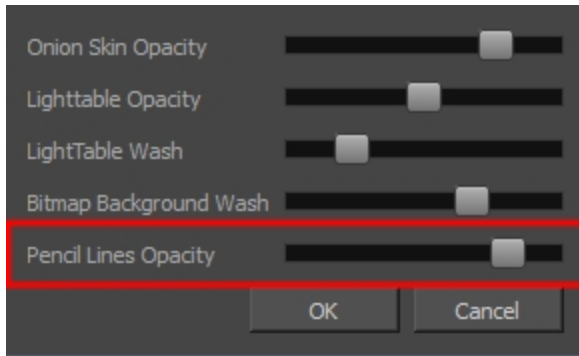

How to Use the Pencil Line Opacity feature

1. In either the Drawing view or Camera view toolbar, click on the Top Light icon. The Pencil Lines Opacity feature can also be accessed through the Preferences panel.

The Onion Skin and Light Table Transparency dialog opens.

2. In the Onion Skin and Light Table Transparency dialog box, use the Pencil Lines Opacity slider to globally increase or decrease the opacity of central vector lines. Sliding the slider all the way to the right equals 100% opacity. Sliding the slider all the way to the left equals 0% opacity.

3. Click OK.

NOTE: If your object has a vector contour outline (created by the Brush tool), this feature will not work. It must have a central vector outline (created by one of the shape tools or Pencil tool).

About Pencil Line Texture

You can apply a texture to a pencil line. Pencil lines support texture. Before drawing, you can select or import a texture and apply it to your lines. You can also change it afterward using the Select tool. Textures are independent from pencil templates.

When you import a texture in your pencil styles, it is saved in your scene. If you want to add that texture to a bank that you will reuse in different scenes, you can add that texture to your preferences.

Selecting Pencil Textures

You can select various pencil textures from a preset list.

How to apply a preset texture to a pencil line

1. In the Tools toolbar, select the Pencil  tool.
2. In the Tool Properties view, the preview area displays the stroke that will be produced after you customize the different parameters in the Tool Properties view. Click the arrow button.

3. In the Pencil Properties editor, select the Texture tab.

4. In the Texture library, select a texture for the pencil.
5. In the Camera or Drawing view, draw a pencil line.

Creating Pencil Textures

You can create your own pencil texture presets.

NOTE: To learn more about the Pencil tool options, see the Reference guide .

How to create a pencil texture template with the Pencil tool

1. In the Tools toolbar, select the Pencil  tool.
2. In the Tool Properties view, click the arrow button beside the stroke preview area.

3. In the Pencil Properties editor, click the New Texture  button or select **New Texture** from the Texture  menu.
 - To delete a preset style, click the Delete Texture  button or select **Delete Texture** from the Texture  menu.
4. Browse for your bitmap texture file.

NOTE: The following file formats are supported: .jpg, .png, .psd, .sgi, .tif. Your texture **MUST HAVE** an alpha channel.

5. Click **Open**.

The imported texture is saved in your texture list.

6. In the Pencil Properties editor, select your new texture.

7. Click the Texture menu  and select **Rename Texture**.

The Rename Opacity Texture dialog box opens.

8. In the Name field, type the template name and click **OK**.
9. In the Camera or Drawing view, draw your pencil line with your new texture.

Applying Pencil Textures

You can apply a pencil texture preset to an already drawn line.

How to apply a preset texture to a pencil line

1. In the Tools toolbar, select the Select  tool.
2. In the Drawing or Camera view, select a pencil line.

3. In the Tool Properties view, select a texture from the Textures area to apply to the selected stroke.

Adding Pencil Textures to your Preferences

You can add a pencil texture to your preset preferences.

How to add a texture to your preferences

1. In the Tools toolbar, select the Pencil  tool.
2. In the Tool Properties view, click the arrow button beside the stroke preview area.

3. In the Pencil Properties editor, select a texture from the Textures area to add to your preferences.
4. Click the Copy to Preference  button.

About Shape Tools

T-HFND-004-006

In Harmony, you can use the shape tools to draw circles, lines and rectangles. You can also easily reshape a square or circle into a much more complex drawing—see [About the Contour Editor Tool on page 224](#) and [About the Pencil Editor Tool on page 227](#).

The available shape tools are:

- Line tool
- Rectangle tool
- Ellipse tool
- Polyline tool

The shape tools use the same pencil presets as the Pencil tool. To learn how to create, delete, rename, import and export presets, see [About the Pencil Tool on page 167](#).

To learn more about the shape tool parameters, see the Reference guide .

Authors

Marie-Eve Chartrand

Christopher Diaz

chrisdiazart.com

Drawing with the Polyline Tool

You can use the Polyline tool to draw long and curvy lines.

NOTE: To learn more about the Polyline tool options, see the Reference guide .

How to draw with the Polyline tool

1. In the Timeline view, select the cell on which you want to draw.
2. In the Tools toolbar, select the Polyline  tool or press Alt + _.
3. In the Camera or Drawing view, click and drag to create a point and a Bezier handle to shape your line.
4. Click a new area and drag to create a second point and Bezier handle.
 - Press Alt to pull only one handle, instead of two.
 - Press Shift to snap the handles to 45, 90, or 180 degrees.

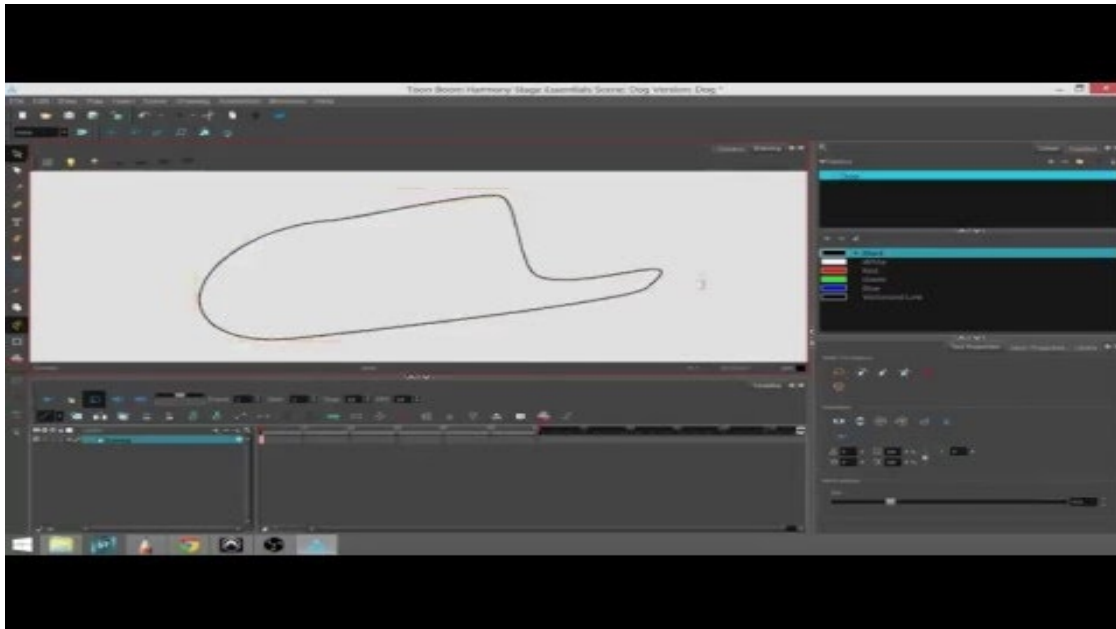

5. Repeat the previous step until your shape is completed.
6. Press Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click to release the Polyline tool from the current path or shape that it is creating. Continue to use the tool to make multiple, independent paths or shapes.
7. If necessary, reshape the lines using the Contour Editor  tool—see [Reshaping a Drawing with the Contour Editor Tool](#) on page 225.

Drawing with the Rectangle, Ellipse, and Line Tools

T-HFND-004-006A

You can use the Line, Rectangle, or Ellipse tool to draw shape without having to trace them. You can also draw perfect circles and squares.

NOTE: To learn more about the shape tool parameters, see the Reference guide .

How to draw with a shape tool

1. In the Timeline or Xsheet view, select the cell on which you want to draw.
2. In the Tools toolbar, select the Rectangle , Ellipse , or Line  tool.
3. To automatically fill the shape, in the Tool Properties view, select the Auto Fill  option.
4. In the Camera view, click and drag to draw the shape.

- Hold down Shift to lock the rectangle or the ellipse ratio to 1:1.
 - Hold down Alt to draw the rectangle or ellipse from its centre.
 - Hold down Shift to snap the line every 15 degrees.
 - Hold down Alt to snap the start or end of the line to a nearby stroke.
5. Use the Contour Editor  tool to deform the shape and create your drawing.

About the Stroke Tool

T-HFND-004-013

There are two different ways to draw invisible lines, using the Pencil tool or Stroke tool.

Using the Pencil tool, you can draw as strokes only, meaning that the line will be invisible. This can be useful for drawing tones and highlights directly on the character.

The Stroke tool draws invisible lines only. You cannot add thickness to the line. Unlike the Close Gap tool that creates a short, straight line between two points, the stroke line will stay exactly where you draw it. This tool can be useful for closing a zone in a particular way or creating some hard shadows or highlight areas.

Sometimes, it may be difficult to see strokes, especially if your colours are similar to the blue stroke colour. In Harmony, you can display the strokes in washed-out colours so the invisible lines stand out.

NOTE: To learn more about the Stroke tool parameters, see the Reference guide

Authors

chrisdiazart.com

Drawing with the Stroke Tool

T-HFND-004-013A

You can draw invisible lines with the Stroke tool as well as with the Pencil tool.

NOTE: To learn more about the Stroke tool parameters, see the Reference guide

How to draw invisible lines with the Stroke tool

1. In the Timeline or Xsheet view, select the cell on which you want to draw.
2. In the Tools toolbar from the Paint drop-down menu, select the Stroke  tool or press Alt + V.
3. From the top menu, select **View > Show Drawing > Show Strokes**  or press K.
4. In the Tool Properties view, you can adjust the smoothness.
5. In the Camera or Drawing view, start drawing.

If you forgot to enable the Show Strokes option before drawing, as soon as you draw a first stroke, a Message dialog box opens.

Select the **Don't Show This Message Again** option if you do not want the dialog box to notify you about the Show Strokes option.

6. Click **OK**.
7. You can modify the stroke shape with the Contour Editor  tool.

How to draw invisible lines with the Pencil tool

1. In the Timeline or Xsheet view, select the cell on which you want to draw.
2. In the Tools toolbar, select the Pencil  tool or press Alt + /.
3. From the top menu, select **View > Drawing > Show Strokes**  or press K.
4. In the Tool Properties view, set the Pen Style size to **0**. You can also adjust the smoothness.
5. In the Camera or Drawing view, start drawing.

If you forgot to enable the Show Strokes option before drawing, as soon as you draw a first stroke, a Message dialog box opens.

Select the **Don't Show This Message Again** option if you do not want the dialog box to notify you about the Show Strokes option.

6. Click **OK**.
7. You can modify the stroke shape with the Contour Editor  tool.

How to show the strokes with washed-out colours

1. From the top menu, select **View > Show > Show Stroke With Colour Wash**.

About the Eraser Tool

T-HFND-004-010

Using the Eraser tool, you can remove parts of your drawing. When erasing brush strokes and painted areas, the contours will keep the shape you traced. When erasing pencil stroke, the central vector will be erased and the line tips will reshape based on the line's parameters.

It is a good idea to create and save erasers with precise sizes and parameters in order to save time when drawing and designing. Toon Boom Harmony provides you with a variety of default eraser styles and allows you to create and save your own.

Eraser presets are created by saving the properties of the current eraser as a preset, in order to reuse it again and again.

The Eraser tool uses its own preset list, separated from the Brush tool.

NOTE: To learn more about each individual parameter, see the Reference guide .

Erasing

T-HFND-004-010A

You can erase portion of your artwork using the Eraser tool.

For information on erasing textured lines, see [How to erase textured lines on page 139](#).

NOTE: To learn more about each individual parameter, see the Reference guide .

How to erase with the Eraser tool

1. In the Timeline or Xsheet view, select the cell that contains objects you want to erase.
2. In the Tools toolbar, select the Eraser  tool or press Alt + E.
3. In the Camera or Drawing view, start erasing.

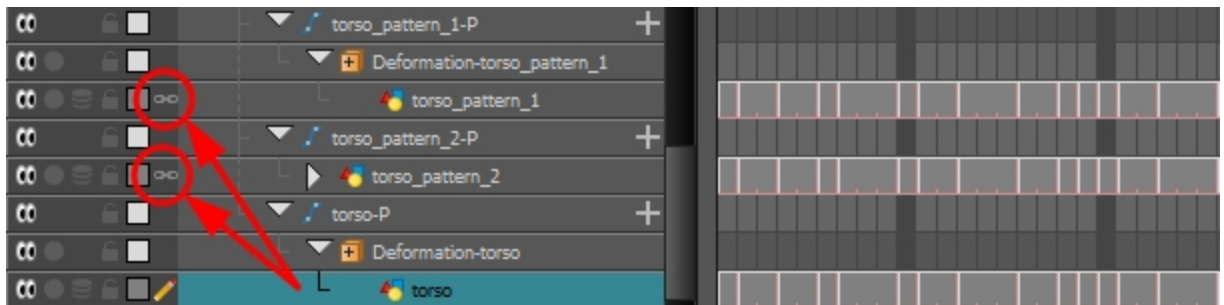

Erasing Synced Drawings

Normally in the Camera view, the only drawings and lines that can be erased are those on the selected layer. The **Apply to Synced Drawing Layers**  option allows for the inclusion of drawings on layers synced to the selected drawing layer.

Layers are synced when drawings need to be separated on different layers, but need to have the same timing.

How to erase synced drawings

1. In the Tools toolbar, select the Erase  tool.
2. In the Timeline view, select a synced drawing layer. When you click on a synced layer, the other layers that it is synced with will display the link icon.

3. In the Tool Properties panel, enable the **Apply to Synced Drawing Layers** option.

4. In the Camera view, start to erase.

Notice that only the selected drawing and its corresponding synced drawings have been erased.

Modifying the Eraser Settings

T-HFND-004-010B

In the Tool Properties view, you can modify the Eraser tool parameters such as the size and smoothing.

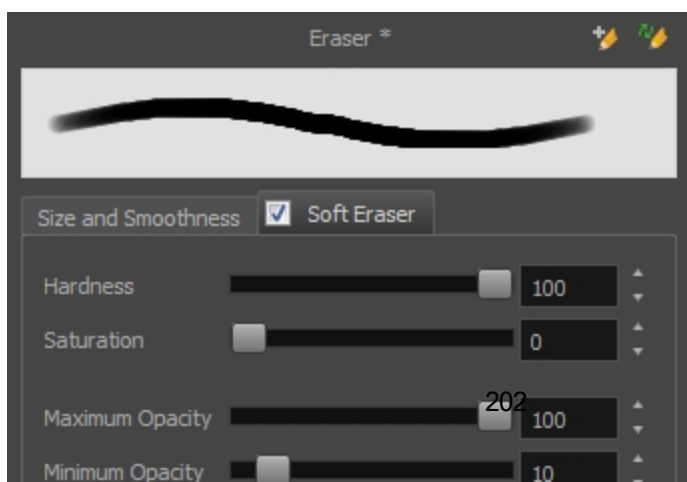

NOTE: To learn more about each individual parameter, see the Reference guide .

How to modify the eraser settings

1. In the Tools toolbar, select the Eraser  tool.
2. In the Tool Properties view, the preview area displays the stroke that will be produced after you customize the different parameters in the Eraser Properties view. Click the arrow button.

The Eraser Properties window opens.

The Size and Smoothness tab is where you set the minimum and maximum sizes of your drawing tool which will produce the thick and thin effect on your stroke.

The Soft Eraser tab needs to be enable for its parameters to become active. This feature only works on soft or textured brush strokes. Both tabs works with the pressure sensitivity of a pen tablet.

Hardness	Defines the softness of the stroke edge. The lower the value, the softer the stroke edge will be. The higher the value, the sharper the stroke edge will be.
Saturation	Lets you adjust the softness of edge feathering. Works in conjunction with the Hardness, e.g. 100% Hardness will yield no results in saturation change. 0% Hardness will allow a fine tuning of the feathering of the soft stroke edge.
Maximum Opacity	The transparency of the brush when the pressure is heavy. A smaller value will leave semi-transparent colour and texture. A larger value will ensure that everything is properly erased. This option is unavailable if the Keep Vectors option is disabled.
Minimum Opacity	Sets the minimum transparency of the brush, in relation to the Maximum Opacity, when the pressure is very light. A smaller value will leave semi-transparent colour and texture. A larger value will ensure that everything is properly erased. This option is unavailable if the Keep Vectors option is disabled.
Keep Vectors	Keeps the vector frames around your strokes intact, only the texture fill disappears. Disabling this option will cut the stroke's vector frame into different pieces when the Eraser tool passes over it. If you disable this option, the maximum and minimum opacity sliders are disabled as well.

Exporting Eraser Presets

You can export your eraser presets for backup, sharing or installing on a different computer.

How to export pencils, brushes and erasers

1. From the Brush menu, select **Export**.
2. In the Export Brushes dialog box, select the bitmap and vector brushes and erasers to export, as well as any pencils.

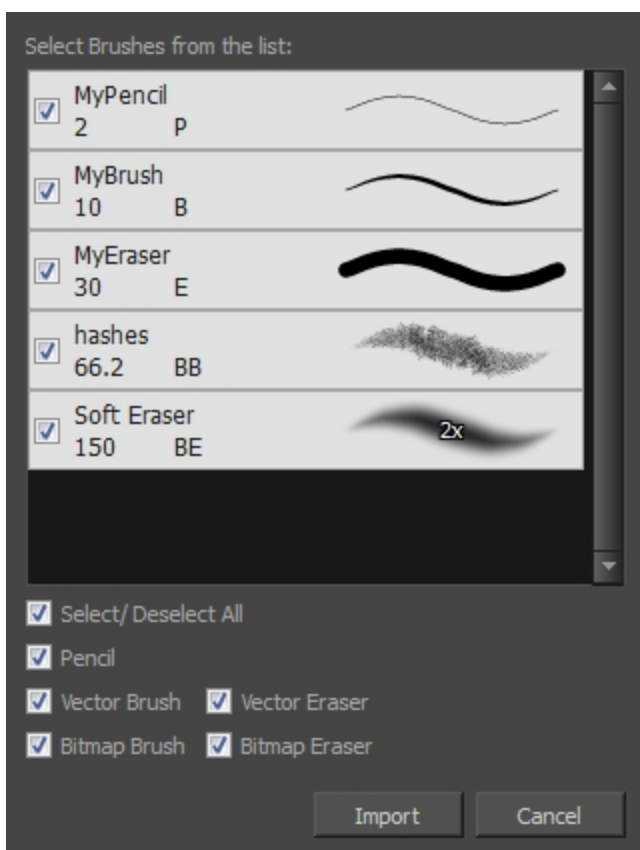

3. Click **Export**.
4. In the Export Brushes window that appears, browse to the location where you want to save the .xml file and give it a name.
5. Click **Save**.

Importing Eraser Presets

You can import Harmony eraser presets you previously exported.

How to import pencils, brushes and erasers

1. From the Brush menu , select **Import Brushes**.
2. In the browser window that appears, navigate to and select the **.xml** file.
3. Click **Open**.
4. In the Import Brushes dialog box, select the brushes brushes and erasers you want to import. You can also import pencils at the same time.

5. Click **Import**.

The imported brush, eraser and pencil styles will appear in the presets library. You can reuse any of the imported tips to create other brush, eraser and pencil style presets.

Changing the Eraser Preset Display

You can display your preset list as thumbnails or a list.

How to change the Presets Library thumbnail display

1. From the Brush menu, select one of the following:

Parameter	Description
Small Thumbnail	Reduces the size of the thumbnails in order to view more at the same time. Displays an image of the tool's tip and its maximum size.
Large Thumbnail	Increases the size of the thumbnails in order to see the images more clearly. Displays an image of the tool's tip, its maximum size and its name.
Stroke View	Displays the tool's name, maximum size and stroke preview.

About the Select Tool

T-HFND-004-005

Before you can edit objects, you must first select them using the Select tool. After that, you can scale, translate, rotate, and resize them, as well as reposition the pivot point.

NOTE: To learn more about the Select tool options, see the Reference guide .

Authors

Marie-Eve Chartrand

Christopher Diaz

chrisdiazart.com

Selecting

Using the Select tool, you can select drawing strokes and groups.

NOTE: To learn more about the Select tool options, see the Reference guide .

How to select objects

1. In the Timeline view, select the cell on which you want to select drawing objects.
2. In the Tools toolbar, select the Select  tool or press Alt + S.
3. In the Camera or Drawing view, select the drawing objects.
 - You can select all the drawing objects in a drawing by using **Edit > Select All** or by pressing Ctrl + A (Windows/Linux) or ⌘ + A (Mac OS X).
4. To deform or reposition a selection:
 - To reposition, click the selected drawing object and drag the selection to a new area.

- To rotate, grab the selection box handle and rotate it.

- To scale, pull or push on the top, side, bottom or corner control point. Hold down Shift to lock the selection's ratio.

- To skew, drag sideways or up and down the sides or top and bottom segments, between the control points.

Selecting Synced Drawings

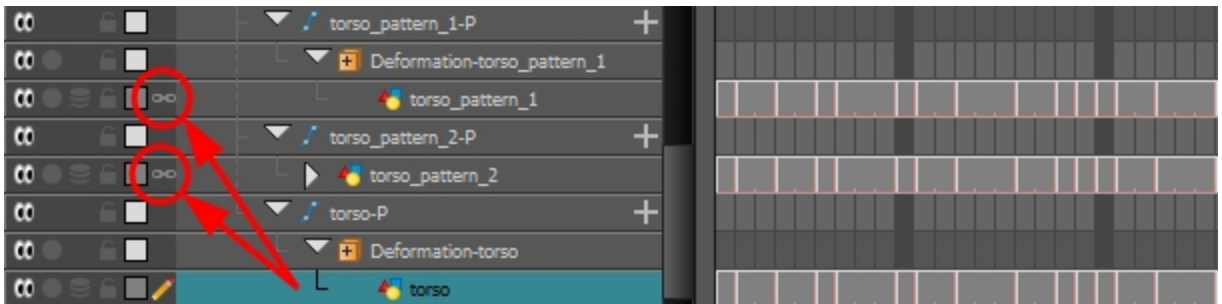

Normally in the Camera view, any visible line or drawing can be selected. When you enable the Works on Single Drawing mode, only drawings from the currently selected layer can be selected.

The Apply to Synced Drawing Layers option works in conjunction with the Works on Single Drawing mode. The Works on Single Drawing mode still limits the selection to a single layer, but the Apply to Synced Drawing Layers option allows for the inclusion of drawings on layers synced to the selected drawing layer.

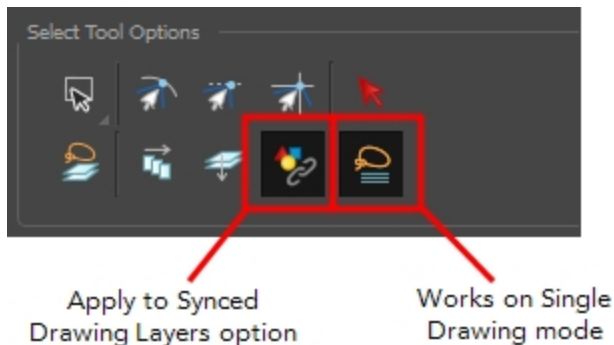

Layers are synced when drawings need to be separated on different layers, but need to have the same timing.

How to select synced drawings

1. In the Tools toolbar, select the Select tool.
2. In the Timeline view, select a synced drawing layer. When you click on a synced layer, the other layers that it is synced with will display the link icon.

3. In the Tool Properties panel, enable the Works on Single Drawing mode and the Apply to Synced Drawing Layers option.

4. In the Camera view, select a drawing or any of its corresponding synced drawings. Notice that only those drawings are selectable.

Inverting a Selection

You can invert your selection to select everything else in your drawing that was not previously selected.

How to invert a selection

1. From the top menu, select **Edit > Invert Selection** or press Ctrl + Shift + I.

You can also find the Invert Selection option in the Camera or Drawing View menu by selecting **Edit > Invert Selection**.

Repositioning the Selection Pivot

You can temporarily reposition the selection's pivot position to rotate, scale, or skew from a different point.

How to temporarily reposition the pivot point

1. In the Camera or Drawing view, select the drawing object you want to transform.

The pivot point appears in the middle of your selection.

2. Click the pivot point and drag it to a new position.

This becomes the new position of the pivot point for the current transformation and will remain there until you make a new selection.

Working on a Single Drawing with the Select Tool

You can set the Select tool to select the artwork on all the layers or on the current layer only. In the Drawing view, it only works on the current layer. In the Camera view, you can set one mode or the other.

NOTE: To learn more about the Select tool options, see the Reference guide .

How to enable the Select Tool Works on Single Drawing preference

1. In the Tools toolbar, select the Select  tool or press Alt + S.
2. Do one of the followings:
 - In the Tool Properties view, click the Works on Single Drawing  button.
 - Select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X). In the Camera tab, go to the Tools section and select the **Select Tool Works on Single Drawing** option and click **OK**.
3. In the Camera view, make your selection. Note that you may need to restart Harmony depending on your system.

About the Repositioning All Drawings Tool

The Reposition All Drawings tool is used to reposition, scale, rotate or skew all drawing strokes on every drawing included in a layer.

If your hand-drawn animation requires to be repositioned in the grid, as soon as you select the Reposition All Drawings tool, all the strokes in all the drawings exposed on the current layer are selected. You can use the controls the same as the Select tool—see [About the Select Tool on page 207](#).

You can use the Drawing Desk feature to select specific drawings and avoid repositioning all the drawings—see [About the Drawing Desk on page 311](#).

NOTE: To learn more about the Reposition All Drawings tool options, see the Reference guide .

Repositioning Drawings

Use the Reposition All Drawings tool to reposition all the drawing strokes on all drawings exposed in the current layer.

NOTE: To learn more about the Reposition All Drawings tool options, see the Reference guide .

How to reposition all drawings

1. From the Tools toolbar, select the Reposition All Drawings  tool. This also automatically selects every stroke in your drawing in the Drawing and Camera view.
2. Do any of the following:
 - To reposition, click and drag your selection to a new area.

- To rotate, rotate the selection box handle.

- To scale, pull or push on the top, side, bottom or corner control points. Hold down Shift to maintain the selection's ratio.

- To skew, drag the sides or top and bottom segments, between the control points.

3. When you release your cursor, every drawing in the drawing layer you repositioned, scaled, rotated or skewed will follow the same transformation.
4. You can also adjust the position by modifying the settings and using the operation buttons in the Tool Properties view.

Repositioning All Synced Drawings

Normally in the Camera view, the only drawings that can be repositioned are those from the selected layer. The Apply to Synced Drawing Layers option allows for the inclusion of drawings on layers synced to the selected drawing layer.

Layers are synced when drawings need to be separated on different layers, but need to have the same timing.

How to reposition all synced drawings

1. In the Tools toolbar, select the Reposition All Drawings  tool.
2. In the Timeline view, select a synced drawing layer. When you click on a synced layer, the other layers that it is synced with will display the link icon.

3. In the Tool Properties panel, enable the Apply to Synced Drawing Layers  option—see the Reference guide .

4. In the Camera view, click and drag the drawings highlighted by a bounding box to a new location.

Notice that only drawings from the selected layer and its corresponding synced drawings have been selected.

5. Delete, move, scale, skew or rotate the cut selection.

About the Cutter Tool

T-HFND-004-007

The Cutter tool lets you cut a drawing to move, copy, or delete it. You can use it to scale or reposition the portion of a flattened or bitmap drawing. you can also use it to trim strokes using a single gesture.

NOTE: To learn more about the Cutter tool options, see the Reference guide .

Authors

Marie-Eve Chartrand

chrisdiazart.com

Cutting Artwork

T-HFND-004-007A

Use the Cutter tool to trim and cut your artwork.

NOTE: To learn more about the Cutter tool options, see the Reference guide .

How to cut drawings

1. In the Tools toolbar, select the Cutter  tool or press Alt + T.
2. In the Camera or Drawing view, select an area to cut away.

- To delete the selected area, press Delete.
- To move the selection, drag it to a new area.
- Use the bounding box controls to scale, skew, or rotate the cut piece.

Cutting Synced Drawings

Normally in the Camera view, the only drawings and lines that can be cut are those on the selected layer. The Apply to Synced Drawing Layers  option allows for the inclusion of drawings on layers synced to the selected drawing layer.

Layers are synced when drawings need to be separated on different layers, but need to have the same timing.

How to cut synced drawings

1. In the Tools toolbar, select the Cutter  tool.
2. In the Timeline view, select a synced drawing layer. When you click on a synced layer, the other layers that it is synced with will display the link icon.

3. In the Tool Properties panel, enable the Apply to Synced Drawing Layers option.

4. In the Camera view, create a region that includes both drawings.

Notice that only drawings from the selected layer and its corresponding synced drawings were repositioned in the Camera view.

About the Contour Editor Tool

T-HFND-004-008

The Contour Editor lets you reshape drawings. By displaying vector points around a shape and the central vector points in a pencil line, you can pull or push on these points to adjust the brush's line thickness. Points can be selected and deleted. Each point has two Bezier handles for correcting the curves between two points. You can modify shapes by pulling and pushing directly on the segment between the points. You can use it to perfect a central shape pencil line, a contour shape brush line, or even create an elaborate shape from a basic ellipse or square.

NOTE: To learn more about the Contour Editor tool options, see the Reference guide .

Authors

Marie-Eve Chartrand

chrisdiazart.com

Reshaping a Drawing with the Contour Editor Tool

T-HFND-004-008A

You can use the Contour Editor tool to reshape vector drawings by editing the points.

NOTE: To learn more about the Contour Editor tool options, see the Reference guide .

How to reshape drawings with the Contour Editor Tool

1. In the Timeline or Xsheet view, select the cell in which you want to draw.
2. In the Tools toolbar, select the Line , Ellipse , or Rectangle  tool. The following example uses the Ellipse tool.
3. In the Tool Properties view, click the Ellipse  button, click the Auto Fill  button and set the pencil size to 0.
4. In the Drawing or Camera view, draw a circle.

5. In the Tools toolbar, select the Contour Editor  tool.
6. In the Drawing or Camera view, click the line to reshape it.

7. Select one or several points by clicking on them or circling around.

8. Press Delete to delete a selected point.

Press Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click on the contour to add a new point to adjust the contour.

9. To modify the shape, you can:

- Pull on the Bezier handle. Both point's handles will move as one.

- Hold down Alt and pull on one of the Bezier handles. The point's handle will move independently from the other one.

- Move the selected points to a new area.

- Pull directly on the line between two points. No selection is necessary. Holding down Shift will limit the contour modification to the curve between the two first points.

- If an anchor point has no visible Bezier handles, hold down the Alt key to display them.
- To add control points, press Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click the line.
- To remove control points, select the control point and press Delete.

About the Pencil Editor Tool

T-HFND-004-009

A pencil line is a central vector shape. Control points are located along the central spine allowing you to adjust the stroke curve and position. Using the Pencil Editor tool, you can adjust the thick and thin areas of pencil lines. Using the Contour Editor tool, you can reposition the spine of the stroke.

NOTE: To learn more about the Pencil Editor tool options, see the Reference guide .

Authors

Marie-Eve Chartrand

chrisdiazart.com

Reshaping Pencil Lines

T-HFND-004-009A

You can use the Pencil Editor tool to reshape the pencil line thickness.

NOTE: To learn more about the Pencil Editor tool options, see the Reference guide .

How to reshape pencil lines

1. In the Tools toolbar, select the Pencil Editor  tool.
2. In the Camera or Drawing view, select a pencil line and click to reshape it.

3. Select one or several points by clicking them or circling around.

4. Press Delete to delete a selected point.

5. Press Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click the central spine to add a set of points to adjust the contour.
6. To modify the shape, you can:
 - Move the selected points to a new area. If you select matching points on each side of the line, holding the Shift key will move them both. This way you can thicken or thin a line from both sides at the same time.

- Pull on the Bezier handle to move both points' handles s one.

- Hold down Alt and pull on one of the Bezier handles. It moves the handle independently from the other one.

- Pull directly on the line between two points. No selection is necessary. Holding down the Shift key will limit the contour modification to the curve between the two first points.

- If an anchor point has no visible Bezier handle, hold down Alt to display them.

About the Smooth Editor Tool

When drawing in a digital application, it is not like drawing on a sheet of paper. Sometimes the lines you draw may look as if they were drawn with an unsteady hand. When this occurs, you may need to correct the look of your lines.

Harmony has a very powerful tool you can use to optimize contours and reduce the number of points on the lines, the Smooth Editor tool.

NOTE: To learn more about the Smooth Editor tool options, see the Reference guide .

Smoothing Lines

You can use the Smooth Editor to smooth out specific areas of your drawing strokes.

How to optimize lines with the Smooth Editor tool

1. In the Tools toolbar, select the Smooth Editor  tool or select **Drawing > Tools > Smooth Editor**.
2. In the Camera or Drawing view, place your pointer over the lines to smooth. You may need to pass over the same line several times to remove more points and make the line smoother. Note that by default, the Smooth Editor tool colour is yellow, it was changed to orange for screen grab clarity—see the Reference guide to learn about the various settings available.

About the Perspective Tool

The Perspective tool lets you deform a drawing selection and alter its perspective. You can use the corner and edge anchor points to warp the shape.

To have even more control points to fully warp a vector image, see [About the Envelope Tool](#).

NOTE: To learn more about the Perspective tool options, see the Reference guide .

Deforming a Drawing with the Perspective Tool

Use the Perspective tool to distort a drawing's bounding box.

NOTE: To learn more about the Perspective tool options, see the Reference guide .

How to deform a drawing with the Perspective tool

1. In the Tools toolbar, select the Perspective  tool from the Contour Editor drop-down menu or press Alt + 0.
2. In the Camera or Drawing view, select a drawing to deform.
3. Click and drag the different anchor points to deform the shape.

About the Envelope Tool

The Envelope tool lets you deform and warp part of a drawing using a grid envelope and Bezier handles. You can warp images to make them look like they are reflected in water or in a deformable mirror.

NOTE: To learn more about the Envelope tool options, see the Reference guide .

Warping a Drawing with the Envelope Tool

You can warp your drawings using the Envelope tool.

NOTE: To learn more about the Envelope tool options, see the Reference guide .

How to warp a drawing with the Envelope tool

1. In the Tools toolbar, select the Envelope  tool from the Contour Editor drop-down menu.
2. In the Timeline view, select a drawing to deform.
3. In the Camera or Drawing view, select the region you want to deform

4. Click and drag the different anchor points and handles to deform the image.

5. To display more controls, in the Tool Properties view, click the Show Advanced Controls  button.

6. Increase the height and width of the grid to get more control points to deform your image.

About the Text Tool

With the Text tool, you can type text in your project using various fonts and text attributes. Text objects are part of a drawing, so you can manipulate them in the same way. OTF fonts are also supported.

Once your text is written, you can break the strings apart to convert the letters into drawing objects that can then be individually modified with tools such as Select, Perspective, Contour Editor, Smooth Editor.

NOTE: To learn more about the Text tool options, see the Reference guide .

Adding Text

You can use the Text tool to add text to your drawings.

NOTE: To learn more about the Text tool options, see the Reference guide .

How to add text to drawings

1. Do one of the following:
 - In the Tools toolbar, select the Text **T** tool.
 - From the top menu, select **Drawing > Tools > Text**.
 - Press Alt + 9.
2. In the Timeline view, select the cell containing the drawing on which you want to add text.
3. In the Drawing or Camera view, click on the location you want the text to begin.

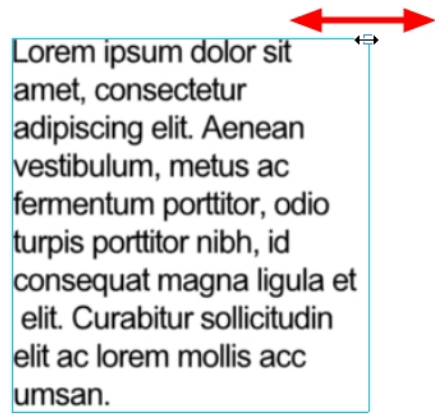

4. You can use the Tool Properties view to select the font, font size and format of the text you will type—see the Reference guide .
5. Type in the desired text.

6. Click outside the text box to exit the typing mode.

If you want to create another text object, click outside the currently active text box. You can always return to edit the text by selecting the Text **T** tool and clicking in the text.
7. You can resize the text box by selecting your text box with the Text **T** tool and moving the anchor point right or left. Using the Select tool will distort and scale your text itself rather than changing the width and height of your text box.

Breaking Text Apart

Text contained in a text field is treated as a single drawing object. You can easily separate the text so each character becomes an individual drawing object that you can select and modify independently.

How to break a text object

1. In the Tools toolbar, click the Select  tool or press Alt + S.
2. In the Drawing or Camera view, select the text object you want to break.

3. From the top menu, select **Drawing > Convert > Break Apart Text Layers**.
 - From the Drawing or Camera view menu, select **Drawing > Convert > Break Apart Text Layers**.

Each character is surrounded by a bounding box that you can modify; they remain text objects that you can edit.

4. If you want to convert your independent letter to a complete vector object that you can deform, use the Select tool to select the letters to convert.
5. From the top menu, select **Drawing > Convert > Break Apart Text Layers** to break the selection into a regular drawing object, with no more text attributes.
 - From the Drawing or Camera view menu, select **Drawing > Convert > Break Apart Text Layers** to break the selection into a regular drawing object, with no more text attributes.

About the Rotate View Tool

The Rotate View tool lets you rotate the Drawing or Camera view, the same way as you would do with a real animation disc for increased flexibility. This tool can also be used in the Perspective view.

The rotation angles for the Camera and Drawing views are independent; if you rotate the Drawing view 25 degrees, if you switch to the Camera view, you can use the rotary table in that view and rotate it to a different angle without affecting the settings in the other view.

When using the Rotate View tool, you are only rotating your workspace. You can not changing the actual rotation angle of your drawings. Exporting your project will completely ignore the Rotate View angle.

The Rotate View tool has no options in the Tool Properties view.

Rotating the Workspace

You can use the Rotate View tool to rotate your drawing workspace.

How to use the Rotate View tool

1. Do one of the following:
 - From the top menu, select **Drawing > Tools > Rotate View**.
 - In the Tools toolbar, select the Rotate View tool.
 - In the Drawing or Camera view, right-click and select **Drawing Tools > Rotate View**.
 - Hold down Ctrl + Alt (Windows/Linux) or ⌘ + Alt (Mac OS X).

The rotary table appears.

2. In the Drawing or Camera view, click and drag to rotate the space.

3. Release the keyboard shortcut or switch to a new drawing tool.
4. Reset the view rotation using **View > Reset Rotation** or press Shift + X to reset the rotation.

About the Hand Tool

You can use the Hand tool to pan through the Drawing or Camera view. When you are zoomed in your workspace, you may need to pan to a different area of your image. You can do so with the Hand tool or the Spacebar keyboard shortcut.

The Hand tool has no options in the Tool Properties view.

How to use the Hand tool

1. Do one of the following:
 - In the Tools toolbar, select the Hand  tool, click in the Drawing or Camera view and drag.
 - You can also Hold down the Spacebar, click in the Drawing or Camera view and move your mouse in the direction you want to pan the view.

About the Zoom Tool

The Zoom tool in the Tools toolbar lets you zoom in and zoom out of the Camera or Drawing view.

NOTE: To learn more about the Zoom tool options, see the Reference guide .

How to use the Zoom tool

1. In the Tools toolbar, select the Zoom  tool available in the Hand tool drop-down menu.
2. Click in the Camera or Drawing view.
3. In the Tools Properties view, do the following:
 - Enable the Zoom In  mode to zoom in mode when you click in the Camera or Drawing view. When you're in Zoom In mode, hold as you click to zoom out.
 - Enable the Zoom Out  mode to zoom out when you click in the Camera or Drawing view.
 - Click on the Zoom In  button to immediately zoom in. You can also press 2.
 - Click on the Zoom Out  button to immediately zoom out. You can also press 1.

About Tool Presets

Tool presets let you save a variety of settings and are very efficient for accessing the tools you use most often. That way, the tool is already set with the desired properties, such as colour, line thickness, whether to enable Draw Behind or Auto Flatten mode, and so on. You can create presets for these tools and many more: Brush, Pencil, Eraser, Rectangle, Ellipse, and Line.

The difference between a tool preset and a brush preset is that when you save a tool preset, you have the option of saving the colour and assigning a shortcut, which you cannot do with brush presets.

The Tool Presets toolbar lets you create new tool presets and manage them.

Displaying the Tool Preset Toolbar

Use the Tool Preset toolbar to create, manage and select your custom tool presets. You can display the toolbar in the Drawing and Camera views as well as the top area.

How to display the Tool Presets toolbar

1. Do one of the following:
 - From the top menu, select **Windows > Toolbars > Tool Presets**.
 - Right-click an empty area below the top menu and select **Tool Presets**.

Tool Presets toolbar

Creating Tool Presets

You can create your custom tool presets to quickly access brushes and pencils settings and colours you use frequently.

How to create a tool preset

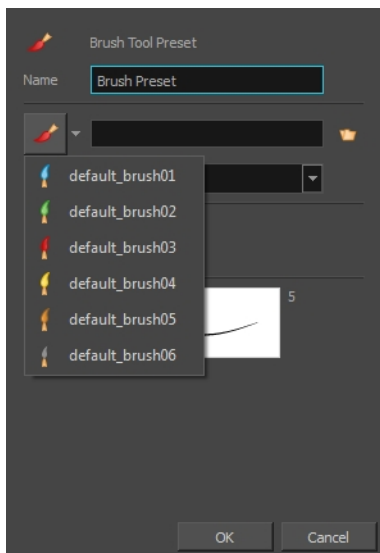

1. In the Tools toolbar, select a tool, for example the Brush tool.
2. Use the Tool Properties view to customize the tool.
3. To set a specific colour for your preset, in the Colour view, select the colour swatch to link to the tool.

NOTE: When using a tool preset in a scene that is not using the assigned colour swatch, a colour recovery dialog box appears prompting you to add the colour to the scene.

4. In the Tool Presets toolbar, click the New Tool Preset button.
5. In the New Preset dialog box, in the Name field, type a name for your new preset.

6. From the icon list, select an icon to quickly identify your preset or upload your own by clicking the File  button.

7. (Optional) From the Shortcut menu, set a keyboard shortcut to quickly access your preset. By default, the shortcuts are unassigned. To assign a keyboard shortcut, select **Edit > Preferences > Shortcuts > Tool Presets** (Windows/Linux) or **Harmony Advanced > Preferences > Shortcuts > Tool Presets** (Mac OS X).
8. When you select an option, it will take effect when you use the tool preset. If an option is deselected, then using a tool preset will not override your current settings.
 - **Colour:** Saves the current colour into the tool preset.
9. Click **OK**.

Selecting Tool Presets

You can select tool presets in the Tool Presets toolbar.

How to select a tool preset

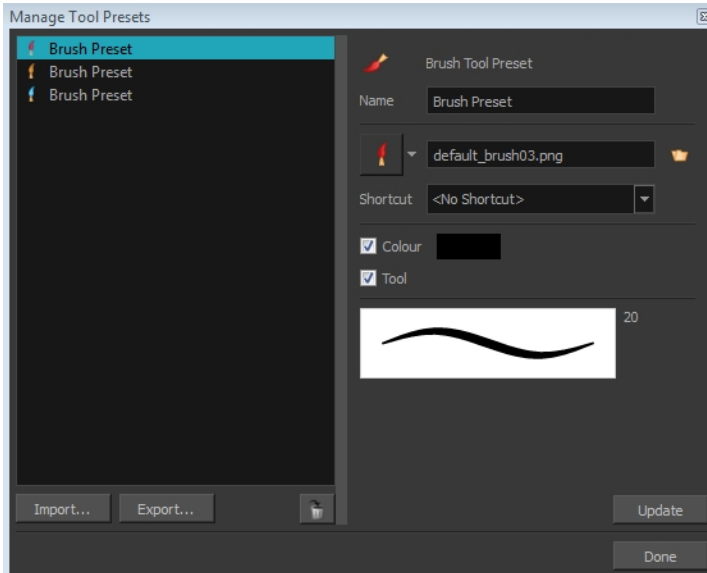

- In the Tool Presets toolbar, click the tool preset  icon you assigned when creating the preset. Note that when using this preset in a new scene not using the assigned colour swatch, a colour recovery dialog box appears prompting you to add the colour to the scene.

Deleting Tool Presets

You can delete unnecessary tool presets to keep your list organized.

How to delete a tool preset

1. In the Tool Presets toolbar, click the Manage Tool Presets  button.

2. From the list of tool presets on the left, select a preset to delete and click the Trash icon.

Updating Tool Presets

You can update existing tool presets through the Manage Tool Presets dialog box.

How to update a tool preset

1. In the Tool Properties view, update the tool settings.
2. In the Tool Presets toolbar, click the Manage Tool Presets  button.
3. In the Manage Tool Presets dialog box, select the tool preset from the list.
4. Update the additional parameters such as the icon, Colour, Layer and Draw Behind options.
5. Click **Update**.
6. Click OK.

Exporting Tool Presets

You can export tool presets for backup, sharing, or installing on a different computer.

How to export a tool preset

1. In the Tool Presets toolbar, click the Manage Tool Presets  button.
The Manage Tool Presets dialog box opens.
2. Click **Export**.
3. In the Export Brush Presets window that opens, click **Export**.
4. Select a folder and click **Select Folder**.

Importing Tool Presets

You can import Harmony tool presets you previously exported.

How to import a tool preset

1. In the Tool Presets toolbar, click the Manage Tool Presets  button.
The Manage Tool Presets dialog box opens.
2. Click **Import**.
3. In the Select Folder window that opens, locate and select the preset(s) to import and click **Select Folder**.

About the Grid

Harmony is equipped with a traditional animation grid. You can use it as a reference while drawing to fit a given layout field chart, align elements, or simply see the center of your drawing. You can draw beyond the grid boundaries as it is only a visual reference.

In the Camera view, the Grid is visible when you select a drawing tool.

Displaying the Grid

You can display the grid and it will be visible in the Drawing view. It will be visible in the Camera view when you select a drawing tool.

Use the Show Grid option to display a grid in the Drawing or Camera views.

How to display the grid

1. Do one of the following:
 - In the Drawing View toolbar, press the Show Grid # button.
 - In the Camera View toolbar, press the Show Grid # button.
 - Select **View > Grid > Show Grid**.
 - Press Ctrl + ' (Windows/Linux) or ⌘ + ' (Mac OS X).

Modifying the Grid

You can modify the look of the grid to be either square, 12-field, 16-field, outline, and so on.

How to modify the grid display

1. Select **View > Grid > Show Grid** to display the grid.
2. To modify the grid, select one of the following:
 - **View > Grid > Grid Outline Only**—Displays the outline of the grid only.
 - **View > Grid > Square**—Displays a standard square grid.
 - **View > Grid > 12 Field Grid**—Displays a 12-field size grid.
 - **View > Grid > 16 Field Grid**—Displays a 16-field size grid.
 - **View > Grid > Underlay**—Displays the grid under the drawing elements.
 - **View > Grid > Overlay**—Displays the grid over the drawing elements.
3. In the Drawing View and Camera View toolbars, you can also add the following buttons—see [Customizing View Toolbars](#) on page 91.
 - Grid Outline Only  button
 - Square  button
 - 12 Field Grid  button
 - 16 Field Grid  button
 - Underlay  button
 - Overlay  button

Grouping Drawing Strokes

Use the grouping options to group and ungroup selected drawing objects and strokes. This can help in the selection, repositioning, re-scaling and other transformations to be applied to multiple objects of a drawing. Grouping does not flatten your objects. You can ungroup your selection at any time. You can also group groups.

How to group strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the strokes to be grouped.
3. Do one of the following:
 - From the top menu, select **Edit > Group > Group**.
 - From the Camera or Drawing view menu, select **Edit > Group > Group**.
 - Press **Ctrl + G** (Windows/Linux) or **⌘ + G** (Mac OS X).

How to ungroup strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the groups to be ungrouped.
3. Do one of the following:
 - From the top menu, select **Edit > Group > Ungroup**.
 - From the Camera or Drawing view menu, select **Edit > Group > Ungroup**.
 - Press **Ctrl + Shift + G** (Windows/Linux) or **⌘ + Shift + G** (Mac OS X).

Arranging Drawing Strokes

The different Arrange options let you reorder drawing objects and strokes inside a single layer in the Drawing or Camera view.

How to arrange drawing strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the strokes to be reordered.
3. Do one of the following:
 - From the top menu, select **Drawing > Arrange > Bring to Front**—Moves the selected art to the front (on top). Press Ctrl + Shift + PgUp (Windows/Linux) or ⌘ + Shift + PgUp (Mac OS X).
 - From the top menu, select **Drawing > Arrange > Bring Forward**—Moves the selected art one level forward (closer to the front). Press Ctrl + PgUp (Windows/Linux) or ⌘ + PgUp (Mac OS X).
 - From the top menu, select **Drawing > Arrange > Send Backward**—Moves the selected art one level lower (behind). Press Ctrl + PgDown (Windows/Linux) or ⌘ + PgDown (Mac OS X).
 - From the top menu, select **Drawing > Arrange > Send to Back**—Moves the selected art behind everything (bottom / back). Press Ctrl + Shift + PgDown (Windows/Linux) or ⌘ + Shift + PgDown (Mac OS X).
4. In the Drawing View and Camera View toolbars, you can also add the following buttons—see [Customizing View Toolbars](#) on page 91.
 - Bring to Front  button
 - Bring Forward  button
 - Send Backward  button
 - Send to Back  button

About Drawing Optimization

As you work, your drawing can get complex and contain multiple strokes. You may want to optimize those drawings to reduce the number of brush strokes, pencil lines, and invisible strokes. You may also want to flatten your artwork or optimize your brush stroke textures.

The Optimize command reduces the number of layers, such as overlapping brush strokes, in the selected drawing objects. Drawing objects will only be flattened and optimized if the selected objects do not change the appearance of the final image when they are merged.

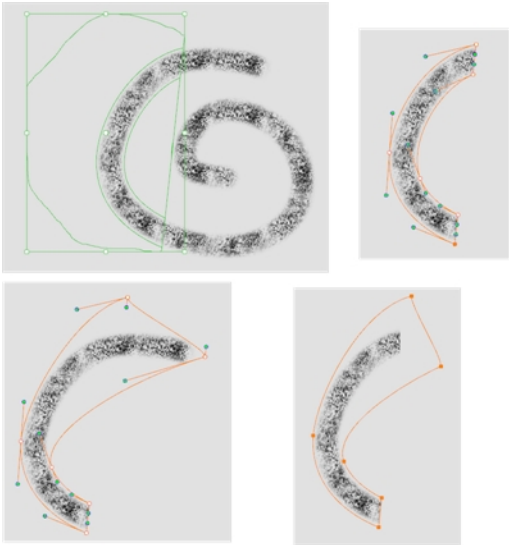

For example, if you have selected a number of partially transparent objects, which you layered to create an additive colour effect, the selected transparent drawing objects will not be merged. This is because merging the transparent drawing objects will cause them to lose the effect of the layered transparent colours.

You could also want to add invisible contour strokes so that if you unpaint lines, the vector container remains to be repainted later.

The Crop Brush Textures option is used to crop an unnecessarily large texture bitmap that lies unseen beneath the vector contour of a textured line. This often occurs when you cut and paste textured lines from one drawing into another. If you cut a portion from a textured line and paste it into a different drawing, Harmony pastes the entire unseen texture bitmap from the source drawing into the new one, even if you only took a small portion of the source drawing. Using the Crop Brush Texture command will crop away extraneous texture that does not touch the vector area. If there are many textured lines in your scene, this will greatly reduce the file size.

In the example shown above, a textured line is cut from a drawing and pasted into a new drawing. At first, it appears as if only a cropped section of the underlying texture bitmap was cut and pasted as well. However, using the Contour Editor tool to expand the vector envelope of the textured line, it is revealed that more texture bitmap exists beyond the cropped boundary. If you use the Crop Brush Texture command, the bitmap texture is cropped to the boundaries of the textured line's vector contour (as seen in the fourth image where the vector envelope has been pulled out to reveal empty space).

Flattening Drawings

The Flatten operation is used to merge drawing objects and brush strokes into a single layer. If you draw new lines to fix a drawing or line with many brush strokes, it can be useful to flatten them all into a single shape. By default, lines are drawn one on top of each other. If you intend to repaint the lines or modify their shape, it will be easier if they are flattened.

How to flatten drawings

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the drawing strokes you want to flatten.
3. Select **Drawing > Optimize > Flatten** or press Alt + Shift + F. You can also press the Flatten  button in the Tool Properties view.

Smoothing Drawings

The Smooth operation is used to reduce the number of contour points on a brush stroke and center points on a pencil line. It also smooths out the shape.

How to smooth drawings

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the drawing strokes you want to smooth out.
3. Select **Drawing > Optimize > Smooth** or press Alt + Shift + S. You can also press the Smooth  button in the Tool Properties view.

Creating Contour Strokes

The Create Contour Stroke option is used to add a permanent invisible line around a shape that was drawn directly in Harmony. This allows you to unpaint your lines with the Paint tool but maintain the shape of the lines, should you need to repaint later.

This command is useful when inking and painting and using the Apply to All Drawings in Layer option.

How to create contour strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, use the Select tool to select the drawing objects you want to create contour strokes for.
3. From the top menu, select **Drawing > Optimize > Create Contour Strokes**.

Removing Contour Strokes

The Remove Contour Stroke option is used to remove any permanently invisible lines that were created while scanning and vectorizing drawings or manually adding contour strokes. This is useful if you want to remove the intersection triangles created during vectorization.

How to remove contour strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, use the Select tool to select the drawing objects you want to remove contour strokes for.
3. From the top menu, select **Drawing > Optimize > Remove Contour Strokes**.

Removing Extra Strokes

The Remove Extra Strokes option lets you remove the invisible lines in your selection.

How to remove extra strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, use the Select tool to select the drawing objects from which you want to remove invisible lines.
3. From the top menu, select **Drawing > Optimize > Remove Extra Strokes**.
 - From the Camera or Drawing view menu, select **Drawing > Optimize > Remove Extra Strokes**.

Optimizing Drawings

You can use the Optimize feature to flatten your drawing strokes without changing the aspect of your drawings. This mainly means that transparencies will not be flattened.

How to optimize a drawing

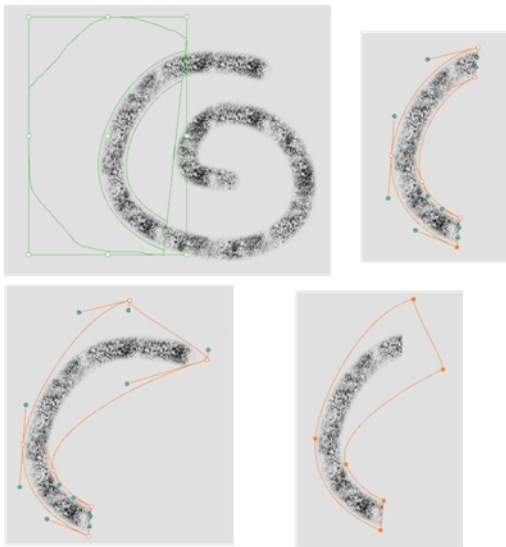

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the drawing strokes you want to optimize.
3. Do one of the following:
 - From the top menu, select **Drawing > Optimize > Optimize**.
 - From the Camera or Drawing view menu, select **Drawing > Optimize > Optimize**.

Cropping Brush Textures

The Crop Brush Textures option is used to crop an unnecessarily large texture bitmap that lies unseen beneath the vector contour of a textured line

How to crop the brush texture

1. In the Timeline or Xsheet view, select the drawing whose texture you want to crop.
2. Do one of the following:
 - From the top menu, select **Drawing > Optimize > Crop Brush Textures**.
 - From the Camera View or Drawing View menu, select **Drawing > Optimize > Crop Brush Textures**.

Reducing the Drawing Texture Resolution

When you import and vectorize as texture (colour) a high resolution image, the size of your drawing can be heavy. You can reduce the size and resolution of the textures in a drawing.

How to reduce the drawing texture resolution

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, use the Select tool to select the drawing objects whose texture resolution you want to reduce.
3. From the top menu, select **Drawing > Optimize > Reduce Drawing Texture Resolution**.
 - From the Camera or Drawing view menu, select **Drawing > Optimize > Reduce Drawing Texture Resolution**.

4. In the dialog box, drag the slider toward the left to reduce the texture resolution.
5. Enable the **Apply to All Drawings** option if you want the modification to be applied to all the drawings in your layer.
6. Click **OK**.

About Strokes Conversion

You may have drawing stroke using the Pencil tool when you wanted to use the Brush tool. You may also have drawing your image using the Polyline tool and now you want to convert your strokes to brush strokes. For many reasons, you may want to switch your stroke types to another type to use the various advantage set they offer.

There are three types of strokes:

- Brush strokes (contour vector)
- Pencil strokes (central vector)
- Invisible strokes (central vector with a thickness value of 0)

Harmony lets you convert pencil lines to brush strokes, brush strokes to pencil lines, and invisible strokes (strokes) to pencil lines.

You can also break text objects apart—see [Breaking Text Apart on page 241](#).

Converting Brush Strokes to Pencil Lines

The Brushes Strokes to Pencil Lines operation converts selected contour strokes into centreline pencil strokes. The brush stroke thickness will be lost.

How to convert brush strokes to pencil lines

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the strokes you want to convert.
3. Do one of the following:
 - From the top menu, select **Drawing > Convert > Brush Strokes to Pencil Lines** or press ^.
 - Right-click on the selection, select **Convert >Brush Strokes to Pencil Lines** or press ^

Converting Pencil Lines to Brush Strokes

The Pencil Lines to Brush Strokes operation converts the selected centreline pencil strokes into contour strokes brush lines.

How to convert pencil lines to brush strokes

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the strokes you want to convert.
3. Do one of the following:
 - From the top menu, select **Drawing > Convert > Pencil Lines to Brush Strokes** or press &.
 - Right-click on the selection, select **Convert > Pencil Lines to Brush Strokes** or press &.
 - In the Tool Properties view, press the Pencil Lines to Brush Strokes  button.

Converting Strokes to Pencil Lines

The Strokes to Pencil Lines operation converts the selected invisible line to a pencil line.

How to convert strokes to pencil lines

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the strokes you want to convert.
3. Do one of the following:
 - Select **Drawing > Convert > Strokes to Pencil Lines** or press Shift + F12 (Windows/Linux only).
 - Right-click on the selection, select **Convert > Strokes to Pencil Lines** or press Shift + F12 (Windows/Linux only)

About OpenGL Antialiasing

Everything you draw in Harmony is vector-based, unless you purposely elected to draw as bitmap. When you draw in the Drawing or Camera view, notice that your lines may appear jagged. This is caused by the fast real-time display called *OpenGL*. If you prefer to see smooth lines as you draw, you can enable the antialiasing preference.

Full scene antialiasing is generated by your computer's graphics card. This antialiasing will not only antialias your drawings, but all your different views in the interface. Full scene antialiasing is an option you can turn on or off; by default, it is disabled.

There is no need to modify your graphic card settings.

NOTE: Full Scene Antialiasing parameters are only valid while you work in your scene. The scene will be rendered to 100% of its resolution regardless of your preference settings or graphic card panel.

Setting the Full Scene Antialiasing Preference

You can enable the Full Scene Antialiasing preference to smooth out the OpenGL artwork.

NOTE: You must restart Harmony after you change the parameters.

How to customize the full scene antialiasing parameters

1. Do one of the following:
 - Select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
 - Press **Ctrl + U** (Windows/Linux) or **⌘ + U** (Mac OS X).

The Preferences dialog box opens.

2. In the OpenGL tab, select the **Enable** option in the Full Scene Antialiasing section.

3. **Number or samples:** Enter the number of samples you want to be used for the antialiasing process. The number of samples is basically equivalent to the amount of times a pixel will be enlarged to calculate the anti-aliasing. This technique is called *supersampling*. The higher the number of samples, the better the anti-aliasing quality will be, but the longer it will take to calculate.
4. Restart Harmony.

About the Tool Colour Swatches

While drawing and painting, you can let Harmony retain the last colour you selected for each one of the following tool types:

- Brush
- Paint
- Pencil, Ellipse, Line, Rectangle, Polyline

The Colour view has three swatches where you can set a colour for the Brush , Paint, and Pencil tools.

You can also link or unlink the colour swatch used between vector and bitmap layers.

Unlinking the Tool Colour Swatches

You can unlink the tool colour swatches and use separated colours for the Brush, Paint, and pencil line tools.

If you prefer to have Harmony use the same colour swatches regardless of the selected tool, you can link the three swatches together.

How to unlink the tool colour swatches

1. In the Colour view, if the storage swatches are linked, click the Link  button to unlink them.

2. Click on the Brush  storage swatch.

3. In the Colour list, select the desired colour.
4. Click the Pencil  storage swatch.

5. In the Colour list, select a colour.
6. Click the Paint  storage swatch.

7. In the Colour list, select a colour.

Linking the Tool Colour Swatches

You can link the tool colour swatches so all the tools use the same colour swatch.

How to link the storage swatches

1. In the Tools toolbar, select one of the following tools:

-  Brush
-  Paint
-  Pencil
-  Polyline
-  Line
-  Ellipse
-  Rectangle

2. In the Colour view, if the storage swatches are unlinked, click the Link  button to link them.

Each time you select a new colour for your current tool, all the storage swatches are updated.

Using Independent Bitmap Colour Swatches

When working in the Colour view, by default the current colour is active for both vector and bitmap layers. You can however, use different reference colours for each layer.

When using bitmap colours, there is no longer a link between the painted zones and selected colour. You can edit the colour as much as you want, but your drawing will not be affected. You can still select colours from your vector colour palette to use the same tint, but you will not create links between your drawing and the swatches.

How to use independent colours

- From the Colour view menu, select **Colours > Independent Bitmap Colour**.

Whichever colour you choose as the reference color is retained for that layer type.

Displaying the Current Drawing on Top

In the Camera view, when you draw on a layer, the artwork is displayed in the correct order. For example, if the layer on which you are drawing is located behind an object on another layer, the lines you draw will be hidden behind that object.

You can display a selected drawing on top of everything while you draw. Then, each time you select a drawing tool, the drawing is displayed in front of everything in the Camera view. The Timeline view ordering remain unchanged.

How to display the drawing on top

1. Do one of the following:
 - From the top menu, select **View > Show > Current Drawing on Top**.
 - In the Camera bottom toolbar, click the Current Drawing on Top  button.

NOTE: The Current Drawing on Top status is retained when you exit Harmony. When you restart the application, the last status will be used.

2. In the Tools toolbar, select a drawing tool. You only need to enable this option once, it is not necessary to do it each time you select a drawing tool.
3. In the Camera view, start drawing.

Chapter 5: Paperless Animation

T-HFND-006-001

Toon Boom Harmony is a powerful paperless animation software that incorporates animation and drawing tools to make your work easier and more efficient.

Although it is a digital process, paperless animation is still hand-drawn and the fundamental principles of animation still apply.

One of the advantages of working with paperless animation is that you do not lose time scanning elements in and testing them because everything is already digital. You can simply draw your animation and play back your line test right away. This also saves the substantial amount of paper required by traditional animation. Another practical advantage is the ability to undo and redo some actions that are often difficult on paper, such as erasing brush strokes.

Creating a Rough Animation

The first step to complete a traditional paperless animation is the rough construction, which is the skeleton of your animation. You would usually start with the main action. For example, to animate a walk cycle, you will start with the torso motion and the legs. Head, arms and clothes will be added later during the secondary animation.

For a satisfactory animation, start by animating the main action with quick, rough sketches, then add the details when you're satisfied with the movement. If you start animating all the details right away, you will lose a lot of time if you have to make corrections, and your animation is likely to look rigid.

How to create a rough animation

1. Press Ctrl + U (Windows/Linux) or ⌘ + U (Mac OS X) to open the Preferences dialog box.
2. Select the **Exposure Sheet** tab.
3. Select the **Use Current Frame as Drawing Name** option. When this preference is enabled, drawings will be named like the frame they are created on (frame number).
4. In the Tools toolbar, select the Brush  tool or press Alt + B.
5. In the Colour view, select a colour for the brush. It is a good idea to choose a light colour for your rough animation. This will make the clean up process easier as your clean dark lines will contrast with your light sketch lines.

6. In the Timeline or Xsheet view, select the cell where you want your first drawing to appear.
7. In the Camera or Drawing view, draw the first key drawing.

8. With your first cell still selected, do one of the following to mark your drawing as a key drawing. This will help you stay organized.
 - In the Mark Drawing toolbar, click the Mark Selected Drawings as Key  button.
 - In the Xsheet view, select **Drawings > Mark Drawing As > Key Drawing**.
 - In the Timeline view, select **Drawings > Mark Drawing As > Key Drawing**.

9. In the Timeline or Xsheet view, select the cell where your next key drawing will appear.
10. In the Tools toolbar, click the Onion Skin  button. This will display the previous and next drawings in a light colour in the Camera or Drawing view, behind your current drawing, so that you can use them as references to draw new drawings with accuracy. This can be useful to draw breakdown poses between two key poses, or to add an in-between drawing between two other drawings.
11. Ensure the onion skin displays your first key drawing, so that you can base your second key drawing on it. To do this, do one of the following:
 - In the Timeline view, drag the blue onion skin markers to extend the number of past and future drawings to display as onion skin, if needed.

- In the Camera View or Drawing View toolbar, use the Onion Skin Add One Previous Drawing , Onion Skin Reduce One Previous Drawing , Onion Skin Reduce One Next Drawing  and Onion Skin Add One Next Drawing  buttons to adjust the span of the onion skin frame by frame.

NOTE: When in the Drawing view, you can use the Onion Skin toolbar to make onion skin display only specific types of drawings, such as key drawings or breakdowns. Keep in mind that this does not work in the Camera view.

12. In the Camera or Drawing view, draw your second key drawing.

13. In the Xsheet or Timeline view, identify the drawing as a key drawing.

14. In the Timeline or Xsheet view, select a cell between the two key drawings.

15. In the Camera or Drawing view, draw your new pose.

16. In the Timeline or Xsheet view, select a new cell and repeat the previous steps for each new drawing.

NOTE: When working with overlay layers in the Camera view, you can enable the Current Drawing on Top  option to make the layer you're working on appear over other layers.

How to review your animation

1. In the Timeline view, use the Enable/Disable All  and Solo  buttons to turn off any layers you don't want to see during playback.

2. In the Timeline view, move the red playhead to the first frame of your animation and click the **Start** button on the Timeline toolbar. Then, move the playhead to the last frame of your animation and click the **Stop** button.

3. In the Playback toolbar, click the Loop  button to enable looping during playback.
4. In the Playback toolbar, click the Play  button to begin playback.

NOTE: While animating, you can use the Flip and Easy Flipping toolbars to review your animation as you go – see [Flipping Animation on page 303](#).

Creating the Tie Down Animation

Once your rough animation is correct, you can start adding extra details, such as arms, clothes or hair. You can add the extra details on the same layer with the same colour or you can also create a new colour so that you can always see your original sketch.

If your primary and secondary animation were done as a rough drawing, it is now time to put your drawing on model, also known as tie down. This means that you have to review your animation and ensure that every single detail is on model and there is no volume distortion. You can do this directly on the original sketch layer or on a new layer.

If you want to keep your rough animation as it is to avoid any mistakes, you can add an extra drawing element and use the Light Table feature to draw over the first drawing element. This technique can also be used if you want to reuse your rough animation for other characters. For example, if you have a rough walk-cycle, you can reuse it for another character and add its personal features in a new layer. This way, you only need to animate the secondary animation instead of the whole body again.

How to create secondary animation on the same layer

1. In the Xsheet or Timeline view, select the cell in which you want to add new details.

2. In the Colour view, create a new colour (give it the same name and add the prefix `_2` or `_sec`, for example) or select the same rough colour as before.
3. In the Drawing Tools toolbar, select your drawing tool.
4. In the Camera or Drawing view, draw the secondary animation.

5. Do one of the following:
 - In the Xsheet or Timeline view, select the next cell in which you want to draw.
 - Press F and G to navigate between your drawings.
6. Do one of the following:
 - Select **View > Onion Skin > Show Onion Skin**.
 - In the Timeline view menu, select **Onion Skin > Show Onion Skin**.
 - Press Alt + O.
7. Extend the onion skin.
8. In the Camera or Drawing view, draw the secondary animation.

9. Use the Flip and Easy Flipping toolbars to review your animation—see the Flip and Easy Flipping toolbars in the Reference guide.

10. You can also use the Playback toolbar to play the animation in real time.

How to create your secondary animation on an extra layer

1. Add a new drawing layer and name it **secondary_animation**.
2. In the Timeline or Xsheet view, select the rough layer's timing.
3. Copy the timing and in the top menu, select **Edit > Paste Special** or Ctrl + B (Windows/Linux) or ⌘ + B (Mac OS X).
4. Choose **Never create drawing files** from the options to paste the timing but not the drawing files.

5. If you are working in the Drawing view, in the Drawing View toolbar, enable the Light Table.
6. In the Xsheet or Timeline view, select the cell where you want to add the new details.

		P	
1		1	1 K
2

4		4	4 B
5		5	5
6			
7		7	7 K

7. In the Colour view, create a new colour (give it the same name and add the prefix `_2` or `_sec`, for example) or select the same rough colour as before.
8. In the Tools toolbar, select your drawing tool.
9. In the Drawing or Camera view, draw the secondary animation on top of your rough drawing.

10. Do one of the following:
 - ▶ In the Xsheet View, select the next cell in which you want to draw.
 - ▶ In the Camera, Drawing or Xsheet view, press F and G to navigate between your drawings.

		P	
1		1	1 K
2

11. Do one of the following:
 - In the top, Drawing View or Camera View menu, select **View > Onion Skin > Show Onion Skin**.
 - In the Timeline view menu, select **Onion Skin > Show Onion Skin**.
 - Press Alt + O.

12. Extend the onion skin.
13. In the Camera or Drawing view, draw the next secondary animation.
14. Use the Flip and Easy Flipping toolbars to review your animation—see the Reference guide .

15. You can also use the Playback toolbar to play the animation in real time.

Cleaning Animation

T-HFND-006-010

When your rough animation is ready, it is time to clean it up and ink it. The clean-up is also called *tracing*. It consists of tracing solid and clean lines over the rough animation to get closed zones. This is the final paperless animation step before the ink and paint step.

You will need to add a new drawing layer to create your clean drawing. This is the equivalent of adding a sheet of paper and tracing the rough using the animation disk. This allows you to keep the roughs and the cleans intact. You only need to lock the rough layer to prevent it from appearing in the scene.

If you plan on tracing your animation in the Drawing view, use the light table to display all the layers in your project.

How to trace animation in a new layer

1. In the Layer toolbar, click the Add Drawing Layer  button and add a new layer.
2. In the Timeline view, click the Lock  button of the layer containing your rough animation to avoid selecting the layer in the Camera view.

3. In the Timeline or Xsheet view, in the new layer, select the cell corresponding to the first key drawing of your rough animation.
4. In the Tools toolbar, select the drawing tool of your choice. The Pencil  tool is recommended.
5. In the Colour view, select a colour for tracing your animation. A dark bold colour, such as black, would ensure that it contrasts well with the light colour of your rough animation.
6. In the Camera or Drawing view, start tracing the first key drawing.

7. If you have some other layers in the way, you can disable them temporarily from the Timeline view so that only the rough animation and clean-up layer are displayed in the Camera view.
8. In the Tools toolbar, click the Onion Skin  button and pull on the blue onion skin handles in the Timeline view to extend the number of frames you can see.
9. In the Camera View or Drawing View toolbar, use the Onion Skin Add One Previous Drawing , Onion Skin Reduce One Previous Drawing , Onion Skin Reduce One Next Drawing  and Onion Skin Add One Next Drawing  buttons to adjust the span of the onion skin frame by frame.
10. In the Timeline or Xsheet view, select the next cell corresponding to a rough drawing.
11. In the Drawing or Camera view, trace your next drawing.

12. Repeat the previous steps for each drawing.

Paperless Animation Tools

To understand paperless animation, you must first discover the tools available. There are, of course, drawing tools, but also practical features such as setting a drawing as a key, breakdown or in-between.

When you create hand-drawn animation digitally, there are certain tools you require in order to work efficiently, as you would with an animation table, paper and pencils.

The onion skin and light table are used to preview previous and next drawings, cells, elements and frames. When designing or animating, it is very useful to see your previous drawings. Just as if you were building a cut-out puppet, you want to view other drawing elements to know where to draw the new element.

Harmony has many useful advanced features such as the Flipping toolbar, enhanced onion skin, extra drawing layers, and automated matte generation.

Creating Empty Drawings

The Create Empty Drawing command automatically creates a drawing in the selected cell, replacing any drawing that may already be exposed in that cell and the following ones until it meets another drawing, key exposure or a blank cell.

How to create an empty drawing

1. In the Timeline or Xsheet view, select the cell in which you want to create an empty drawing.
2. Do one of the following:
 - In the top menu, select **Drawing > Create Empty Drawing**.
 - In the Xsheet view menu, select **Drawings > Create Empty Drawing**.
 - In the Xsheet view toolbar, click the Create Empty Drawing  button.
 - In the Timeline view toolbar, click the Create Empty Drawing  button.
 - Press Alt + Shift + R.

The new drawing is created in the Xsheet and Timeline view.

About the Onion Skin

The Onion Skin tool lets you preview the previous and next drawings. By default, the previous drawings appear in a shade of red and the next drawings are displayed with a shade of green. You can change these colours in the Preferences dialog box.

Enabling the Onion Skin

You can enable the onion skin to see your previous and next drawings as reference,

NOTE: You can modify the onion skin display in the Preferences panel.

How to enable the onion skin

1. Do one of the following:

- From the top menu, select **View > Onion Skin > Show Onion Skin**.
- In the Timeline view, click the Onion Skin  button on a layer.

- In the Tools toolbar, click the Onion Skin  button.
- Press Alt + O.

Blue arrows appear on both sides of the play head.

2. Drag the blue arrows to add more frames to the onion skin display.

Displaying Marked Drawings in the Onion Skin

In the Drawing view, you can set up your onion skin to display marked drawings only, in the same way that you flip through your drawings marked as key, breakdown or in-between drawings—see [About Marked Drawings on page 305](#)

How to display marked drawings in the onion skin

1. From the top menu, select **Windows > Toolbars > Onion Skin**.

2. In the Tools toolbar, click the Show Onion Skin  button.
3. In the Timeline view, pull on the blue arrows to extend the number of drawings displayed in the onion skin preview.

4. In the Camera View or Drawing View toolbar, use the Onion Skin Add One Previous Drawing , Onion Skin Reduce One Previous Drawing , Onion Skin Reduce One Next Drawing  and Onion Skin Add One Next Drawing  buttons to adjust the span of the onion skin frame by frame.
5. In the Onion Skin toolbar, enable the markers you want to see in your Onion Skin preview.

Displaying the Onion Skin in the Other Layers

You may need to see the onion skin for the other layers previous and next drawing. The Light Table option in the Onion Skin toolbar allows you to do that.

How to enable the onion skin in other layers

You might need to refer to previous and next drawings in other layers than the current one. In the Drawing view, use the Enable Onion Skin in Other Elements feature to see the previous and next drawings of the layers visible in Light Table mode.

1. In the top menu, select **Windows > Toolbars > Onion Skin**.

2. In the Tools toolbar, click the Onion Skin  button.
3. In the Drawing view, click the Light Table  button.
4. In the Timeline view, pull on the blue arrows to extend the number of drawings displayed in the onion skin preview.

5. In the Camera View or Drawing View toolbar, use the Onion Skin Add One Previous Drawing , Onion Skin Reduce One Previous Drawing , Onion Skin Reduce One Next Drawing  and Onion Skin Add One Next Drawing  buttons to adjust the span of the onion skin frame by frame.
6. In the Onion Skin toolbar, enable the Enable Onion Skin in Other Elements  option.

- The current layer is displayed by default in shades of green and red.
- Drawings in timeline layers above the current layer are displayed by default in shades of blue.
- Drawings in timeline layers below the current layer are displayed by default in shades of yellow.

NOTE: You can change the default onion skin display colours in the Preferences dialog box.

Flipping Animation

Toon Boom Harmony allows you to rapidly flip through drawings in the Drawing view just as you do with paper drawings. You can flip through the key, breakdown or in-between drawings individually, or view a combination.

NOTE: To learn more about these toolbars, see the Reference guide .

How to flip through drawings

1. Do one of the following:

- In the top menu, select **Windows > Toolbars > Easy Flipping**.

- Select **Windows > Toolbars > Flip**.

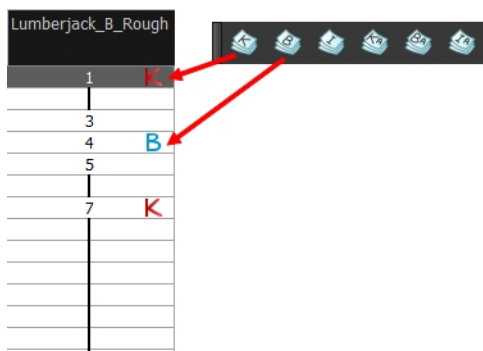

2. In the Easy Flipping toolbar, click the Previous ◀ or Next ▶ button to see the previous or next drawing of your animation.
3. To display drawings in the first frame after you reach the last frame of your animation, select the **Loop** option.

4. Move the slider to the right to flip forward and to the left to flip backward through your drawings.

- The further you move the slider to the left or right, the faster the drawings will flip.
5. Enter in a Preroll value to set the number of drawings to be flipped through before the starting drawing. The starting drawing is determined by the position of the red playhead in the Timeline view.
6. Enter a value in the FPS (frames per second) field to set the speed of flipping.
7. Click on the Easy Flip button ▶ to automatically flip through the drawings based on the FPS.
8. If you marked some of your drawings, you can flip through the markers and avoid seeing all the in-betweens. Enable the Flip Key, Breakdown or In-between buttons in the Flip toolbar to see only one type or a combination—see [Paperless Animation Tools](#)

About Marked Drawings

T-HFND-006-004

When working with several animators, directors or even other studios, the necessity for retakes will often arise. Harmony gives you the possibility to mark new drawings as either Retake Key, Retake Breakdown, or Retake In-betweens. In the Xsheet view, you can identify drawings as Key, Breakdown or In-between.

About the Key Drawing

A key drawing is a visually significant pose in a movement, often an extreme position. For example, if a character that is sitting down falls on his back, the key poses would be the character sitting and the character on his back. Of course, it may vary from one animation to another.

About the Breakdown Drawing

A breakdown drawing is a pose somewhere between two key poses that better shows the movement. Most animation moves are arcs, such as an arm waving, somebody bending, or a leg walking. All of these movements are rotations. The breakdown pose is used to describe this curve better.

The breakdown drawing is then used to indicate secondary poses, also called the *follow-through*. These actions can be a big stomach jiggle as somebody jumps, a cloak floating behind somebody that is running, or arms moving after the main body action. These moves will generally have a different timing than the primary action. They will mainly start later and finish later. So, the breakdown drawings are used to complete the key drawings.

Note that a breakdown drawing is not always placed exactly in the middle of two keys. It will often be closer to one or the other depending on the timing and the action. Also, you can have more than one breakdown pose between two keys.

Marking Drawings

T-HFND-006-004A

You can mark your drawings as Key, Breakdown, or other custom marks.

How to mark a drawing as Key, Breakdown or In-between

1. From the top menu, select **Windows > Toolbars > Mark Drawing**.

The Mark Drawing toolbar displays.

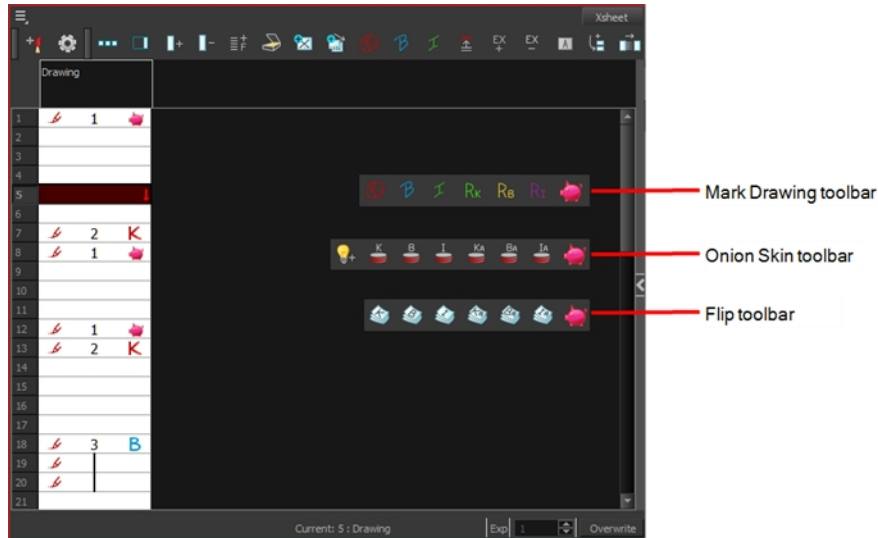

2. In the Xsheet view, select the cell you want to identify. This option is not available in the Timeline view.
3. In the Mark Drawing toolbar, click one of these buttons: Mark as Key Drawing , Mark as Breakdown Drawing  or Mark as In-between Drawing . In the Xsheet menu, you can also select **Drawing > Mark Drawing As > Key Drawing, Breakdown Drawing, In-between Drawing, Retake Key, Retake BD and Retake IB**.
 - If you selected Mark as Key Drawing, a **K** icon appears in the cell.
 - If you selected Mark as Breakdown Drawing, a **B** icon appears in the cell.
 - If you selected Mark as In-Between Drawing, there is no icon displayed in the cell since it is used to remove a Key or Breakdown marker.

Creating Custom Markers

If your production requires you to mark drawings with a custom marker, you also have the option to create your own.

Make custom marks for the Xsheet by creating your own icons, then cutting, pasting and changing a bit of code. Not only is it possible to have your custom mark appear in the Xsheet and Mark Drawing toolbars, but also in the Onion Skin and Flip toolbars.

NOTE: You can create custom shortcuts for the Drawing Identification options in the Preferences dialog box.

How to create custom markers

1. With a bitmap editing software, create the following icons in PNG format:
 - Mark Drawing Toolbar icon (24 x 24 pixel)
 - Onion Skin Toolbar icon (24 x 24 pixel)
 - Flip Toolbar icon (24 x 24 pixel)
 - Xsheet Column icon (16 x 16 pixel)
2. Close Harmony.
3. When your icons are ready, open the Toon Boom Harmony `drawingTypes.d` folder.
 - **Windows:**
 - Toon Boom Harmony Premium: C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony\full-1200-

pref\drawingTypes.d

- Toon Boom Harmony Advanced: C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom StageAdvanced\full-1200-pref\drawingTypes.d

- **Mac OS X:**

On Mac OS X, the Library folder is a hidden folder. To display the folder, hold down the Alt key.

- Toon Boom Harmony Premium: /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Harmony/full-1200-pref/drawingTypes.d
- Toon Boom Harmony Advanced: /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Stage Advanced/full-1200-pref/drawingTypes.d

- **Linux:**

- /home/user_name/Toon Boom Animation/Toon Boom Harmony/full-1200-pref/drawingTypes.d
- /home/user_name/Toon Boom Animation/Toon Boom StageAdvanced/full-1200-pref/drawingTypes.d

In Harmony Server, the path is global for all users so you must create the folder and place in /USA_DB.

- /USA_DB/drawingTypes.d

NOTE: If the **drawingTypes.d** folder does not exist, you must create it. To do so, copy the **resources** folder from the following location.

- Windows: **Start > Programs > Harmony 14 Advanced**
- Mac OS X: **Applications > Toon Boom Harmony 14.0 Advanced > resources > drawingTypes.d**
- Linux: /usr/local/ToonBoomAnimation/harmony_12/lnx86_64/bin/StageAdvanced/resources/drawingTypes.d

4. Paste your icons in the **drawingTypes.d** directory.
5. In the same directory, open the **drawingTypes.xml** file in a text editor.
6. For each custom icon you want to create, add the following line. Make sure to place it before this closing tag: **</DrawingTypes>**.
 - **<DrawingType text="NewButtonName" pixmapFile="XsheetIcon.png"**

```
commandIcon="MarkDrawingIcon.png" flipIcon="FlipIcon.png" onionIcon="OnionIcon.png"  
</>
```

7. In that line, replace the following information with your new icon information:
 - `NewButtonName`: Write the name of your new marker. This name will appear in the button tooltip.
 - `XsheetIcon.png`: Write the name of the icon that you created to appear in the Xsheet column. Include the file extension.
 - `MarkDrawingIcon.png`: Write the name of the icon that you created to appear in the Mark Drawing toolbar. Include the file extension.
 - `FlipIcon.png`: Write the name of the icon that you created to appear in the Flip toolbar. Include the file extension.
 - `OnionIcon.png`: Write the name of the icon that you created to appear in the Onion Skin toolbar. Include the file extension.
8. Save the file and close it.
9. Start Harmony.

About the Drawing Desk

You can work on a portion of an animation sequence or specific drawings from different layers. To do this, select the segment needed in one or more layers in the Xsheet or Timeline view and then use the drawing desk to allow you to work only on these drawings.

This can be useful when you need to reposition drawings, use the Shift and Trace feature, paint multiple drawings at once, or apply the same transformation to drawings for different layers—see [About Shift and Trace on page 315](#).

The Drawing Desk is only available in the Drawing view.

Adding Drawings to the Drawing Desk

You can send drawings your selected in the Xsheet view to the drawing desk. You can also send new drawings to an existing set in the Drawing Desk.

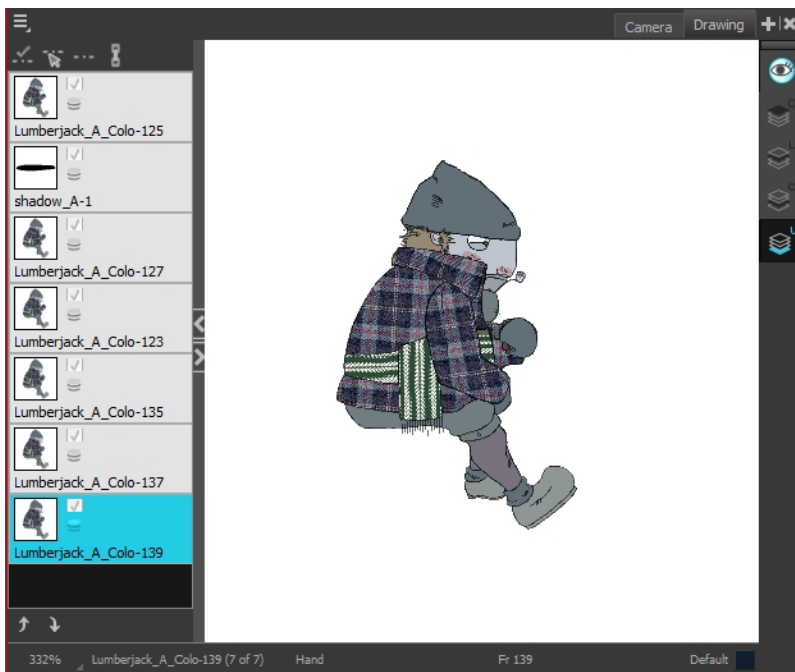

How to send several drawings to the drawing desk

- Do one of the following:
 - In the Xsheet or Timeline view, select a consecutive cell range from one or several layers.
 - In the Xsheet view, hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click on any cell to add it to the selection, even if it is not consecutive.

- Do one of the following:
 - In the Timeline or Xsheet view menu, select **Drawings > Send Drawings to Desk**.
 - In the Xsheet view, right-click and select **Send Drawings to Desk**.
 - In the Xsheet view, hold down the Alt key and click on the selection.

The drawing desk opens on the side of the Drawing view.

NOTE: The drawing desk is by default on the left side of the Drawing view. You can change its positioning in the Preferences dialog box.

3. If the drawing desk side panel is hidden, click the Arrow button, located on the right side of the view.

How to add more drawings to the drawing desk

1. In the Timeline or Xsheet view, select the drawings to be added.
2. Do one of the following:
 - In the Timeline or Xsheet view menu, select **Drawings > Add Drawings to Desk**
 - **Alt +** click the selection.

Modifying Thumbnails in the Drawing Desk

For your convenience you can modify the way the thumbnails are displayed in the Drawing Desk.

How to clear drawings and send new ones to the drawing desk

1. Select a new drawing in the Timeline or Xsheet view.
2. In the Timeline or Xsheet view menu, select **Drawings > Send Drawings to Desk**.

The previous drawing desk selection is removed and replaced with the current selection.

How to change the size of drawing desk thumbnails

- Right-click the drawing desk and select **No Thumbnail, Small Thumbnail, Medium Thumbnail** or **Large Thumbnail**.

How to change the position of a thumbnail in the drawing desk

1. In the drawing desk, select the thumbnail.
2. Click the Move Drawing Up  and Moving Drawing Down  buttons as needed, to move it to the new position in the drawing desk.

How to clear selected or all drawings from the drawing desk

1. In the drawing desk, select one or more drawings to remove.
2. Do one of the following:
 - Right-click the drawing desk and select **Remove Selected Drawings** or **Remove All Drawings**.
 - In the Drawing view, press Esc to remove all drawings.

About Shift and Trace

When hand drawing animation, it is very important to stay on model as it is easy to lose the proportions or features of a character. The Shift and Trace feature lets you temporarily move a drawing so you can trace it on a new drawing. This is similar to animators working on an animation light table and using an entire character or cut-out pieces of a character and moving it underneath the new drawing to trace it.

Your drawings will not be modified. It will only be moved, rotated or scaled in the Shift and Trace mode. When you turn off this mode, the repositioned drawing returns to its normal state.

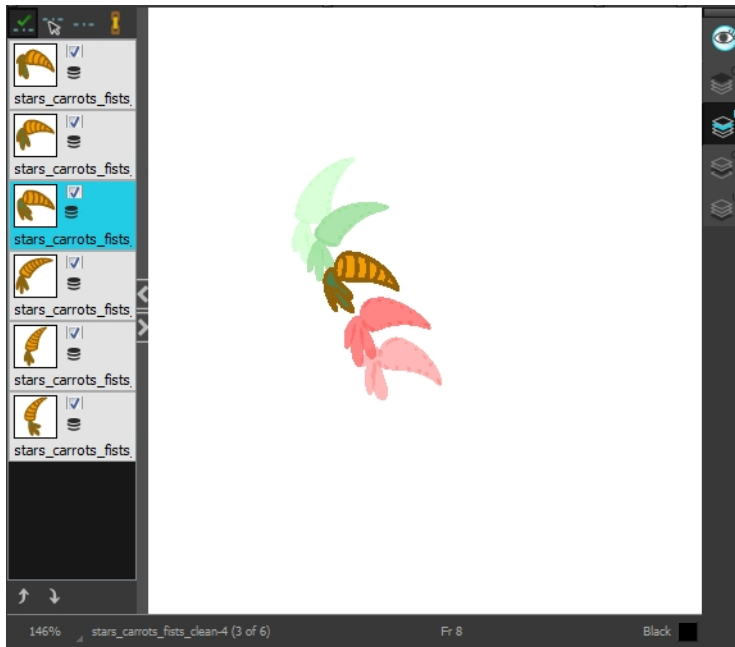

If you use the Shift and Trace feature frequently, you can assign custom shortcuts for Shift and Trace operations in the Preferences dialog box—see the Preferences guide.

Enabling Shift and Trace

You need to send drawings to the Drawing Desk and enable the Shift and Trace option to be able to use it—see [About the Drawing Desk on page 311](#).

How to enable the Shift and Trace mode

1. Go to the Drawing view.
2. In the Tools toolbar, click the Show Onion Skin  button—see [Paperless Animation Tools](#).
3. Send the selected drawings to the drawing desk—see [About the Drawing Desk on page 311](#).

4. In the Drawing Desk toolbar, click the Shift and Trace Enable  button.
Registration marks appear at the bottom of your drawings.

Shifting Drawings

Once the Shift and Trace option is enabled, you can use the controls to shift the drawings. This does not modify your original drawings.

How to shift

Using the shift and trace manipulator, you can move the registration marks to reposition selected drawings while you work.

1. In the Drawing Desk toolbar, click the Shift and Trace Manipulator  button.

At the bottom of the Drawing view, a window displays a zoomed in view of the manipulator. You can move the dividing line between the manipulator and the Drawing view to resize the area.

2. In the Drawing view, transform the drawing as needed, positioning it between your two key poses.
 - To reposition, click and drag the drawing to a new area.

- To rotate from the centre peg, click the flat peg hole and rotate.

- To scale, pull or push on the triangle control.

- To show the pivot point, hold Alt. The pivot point is in the middle of your current drawing view. To rotate from the pivot point, hold Alt and rotate.

- To scale from the pivot point, hold Shift and move your cursor.

- Click and drag the pivot point to move it to a new position. Once the pivot point is moved, you can hold Alt and move your drawing to show it again.

3. To select another drawing and reposition it, hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X).

4. If necessary, click the Shift and Trace Reset  button to reset the position of the modified drawing.

Tracing Drawings

You can trace your new drawings once you shifted the reference artwork.

How to trace

1. In the drawing desk, select the drawing into which you want to trace.

2. Select the check box next to the drawing you want to allow to be temporarily transformed. By default, all drawings are enabled for Shift and Trace operations.

3. Select the drawing you want to move.

4. If you want to trace more than one drawing at the same time, you can link them together. In the drawing desk, select several drawings and click the Link Drawings  button to lock their position together—see [Tracing Drawings](#).
5. In the Tools toolbar, select a drawing tool.
6. In the Drawing view, trace your drawing.

Linking Drawings in the Drawing Desk

When using the Shift and Trace feature, you can link different drawings from the drawing desk, so they move together when dragging or scaling. These drawings can be from different columns in the Xsheet view.

How to link your shift and trace drawings

1. In the drawing desk, display the drawings you want to use for the Shift and Trace operation.
2. Hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X) and select the drawings you want to link together.
3. In the Drawing Desk toolbar, click the Link Drawings  button to enable linking.

Coloured boxes appear beside drawing thumbnails to identify different linked drawing groups.

A link icon appears beside the currently selected drawing and all drawings linked to it.

4. Shift your linked drawings.

5. To unlink your drawings, select one of the linked drawings and click the Link Drawing  button again to disable it.
6. You can shift your drawings independently.

7. To unlink your drawings, select one of the linked drawings and click the Link Drawing  button again to disable it.

Enabling the Drawing Desk Onion Skin

You may end up with a lot of drawings in your onion skin display while working with the Shift and Trace feature. You can disable individual drawings from the onion skin display without deactivating them.

How to enable and disable individual onion skin drawings

1. In the Tools toolbar, click the Onion Skin  button.
2. In the Drawing Desk, click on the drawing's Onion Skin  button to enable or disable it. When enabled, the icon's  colour changes .

About Art Layers

T-RIG-005-000

Art layers give you the possibility to divide the artwork in your drawing on different layers. For example, you can separate the outline and colour fill on two art layers, similar to 1950s traditional cell animation. These art layers are contained within a single drawing as opposed to the layers in the Timeline view or Xsheet columns where individual drawings with individual timing are stacked one on top of the other—see [About Art Layers on page 325](#).

Toon Boom Harmony drawings include two layers in Advanced Art mode.

-  [Line Art on page 326](#)
-  [Colour Art on page 326](#)

Each layer can be used for separate hand-drawn animation tasks, letting you organize your work and facilitate creation and revision.

Overlay

The Overlay layer can serve multiple purposes:

- Highlights and tones
- Annotations and corrections

- Sketching

You can also draw in the Overlay layer as it's a regular layer.

Line Art

In hand-drawn animation, the Line Art layer is mainly used to trace and clean up animation. The outline is drawn in the Line Art layer and colour is painted in the Colour Art layer.

Colour Art

In hand-drawn animation, you use the Colour Art layer to paint your animation. The outline is drawn in the Line Art layer and colour is painted in the Colour Art layer. Strokes (invisible lines) are generated from Line Art to contain the painted area.

When you are doing rough animation, you may want to send a clip for feedback or approval before carrying on with your work. If you have several characters in your project that are overlapping, it may be difficult to understand what is going on as you can see through the characters. Toon Boom Harmony can generate a matte automatically in the Underlay, or even in the Colour Art layer, and fill all the zones inside your characters to make them opaque. This process is fast and easy, and allows you to send easy-to-understand movies.

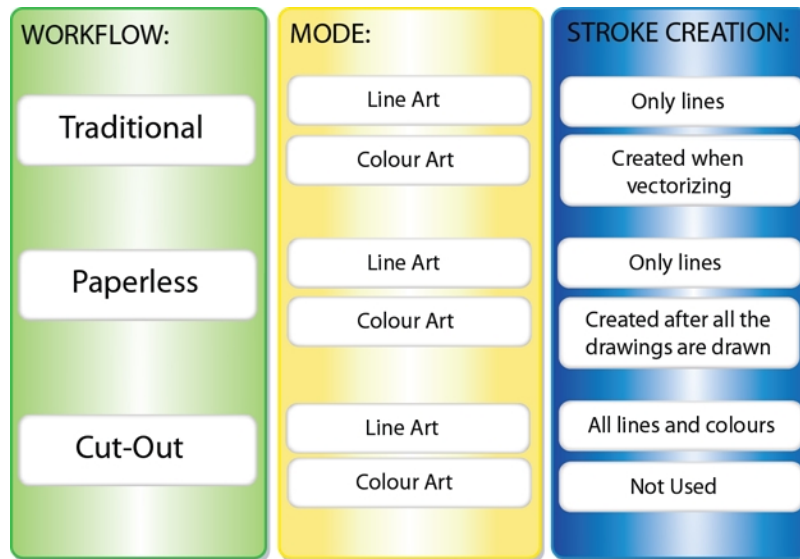

Underlay

The Underlay layer can serve multiple purposes. It is frequently used by animators to sketch rough animation or generate a matte colour when doing line testing.

Separated Lines and Colours

A drawing is composed of line and colour filling layers. Lines and colours can be separated or kept together, depending on which animation process you use. The following diagram presents Line Art and Colour Art layers recommendations based on the selected animation workflow.

When a traditional drawing is scanned, strokes are automatically created in the Colour Art from the Line Art when drawings are vectorized unless you specified otherwise.

When working with Cut-out animation, we recommend that you do all of the work in the Line Art.

Once the drawing sequence is completed for paperless drawings, you can proceed with creating Colour Art strokes if you plan to paint the animation in the Colour Art. Use the Create Colour Art from Line Art option to create strokes from your lines.

You can create strokes in the Colour Art during the following stages:

- After the full drawing is completed in Line Art
- While drawing in Line Art

You may have some traditional drawings that need to be fixed; for example, needing extra lines to patch gaps. Use the Auto-Creat Colour Art from Brush option to create the strokes at the same time as the lines are drawn. This creates strokes from the lines and brush strokes created in the Line Art while you draw and is useful for fixing drawings. However, if you are drawing a new sketch, it is better to create the strokes afterward using the Create Colour Art from Line Art option.

NOTE: Make sure to select the Advanced Art Mode in the Preferences dialog box to use this feature.

Enabling the Overlay and Underlay Support

By default, the Overlay and Underlay art layers are disabled to simplify the workflow. You can enable the support of those additional art layers in the Preferences panel.

How to enable the Support Overlay and Underlay Arts option

1. Select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
2. In the Preferences dialog box, select the **Advanced** tab.
3. In the Advanced Options section, select the **Support Overlay and Underlay Arts** option.
4. Click **OK**.

Switching between Art Layers

You can use the Art Layers toolbar and keyboard shortcuts to switch between art layers.

How to switch between drawing layers

1. In the Art Layer toolbar, click the Line Art  or Colour Art  buttons. When switching art layers, you can edit the select layer without affecting the other one.

2. Click the Preview All Enabled Art Layers  button to display all layers together. Even when the Preview mode is enabled, you will only be able to edit the select art layer. The other ones are only displayed as a reference. By default, the Preview mode is always enabled in the Camera view. You will only be able to see the selected art layer by itself if you enable the Current Drawing on Top  option located in the Camera bottom toolbar.

NOTE: To edit both Line Art and Colour Art at the same time, you must enable the Apply to Line Art and Colour Art  button in the Tool Properties of the tools supporting the operation.

How to switch between the drawing layers in Advanced Art mode

1. In the Art Layer toolbar, click the Overlay Art , Line Art , Colour Art  or Underlay Art  buttons to display the appropriate layer—see [How to enable the Support Overlay and Underlay Arts option on page 329](#). When switching art layers, you can edit the selected layer without affecting the other one.

2. Click the Preview All Enabled Art Layers  button to display all the layers together. The other ones are only displayed as a reference. By default, the Preview mode is always enabled in the Camera view. You can view only the selected art layer if you select the Current Drawing on Top  option in the Camera bottom toolbar.

Creating Colour Art from Line Art

T-RIG-005-000B

Lets you use the outline you traced on one of the four embedded layers (line art, colour art, overlay, underlay) and create invisible strokes to paint your drawings on separate layers. This provides more inking and painting flexibility.

You can also configure this option to create the invisible strokes on any of the four embedded layers.

How to create Colour Art zones from the Line Art layer

1. In the Tools toolbar, select the Select  tool or press Alt + S.
2. In the Tool Properties view, click the Permanent Selection  button if you want to apply the operation on all drawings in the layer.
3. In the Camera or Drawing view, select the artwork to transfer to the Colour Art. Create a selection around the entire animation sequence if you want to apply the operation to all your drawings.
4. In the Drawing View toolbar, click the Create Colour Art from Line Art  button or press *.

How to create strokes with the Create Colour Art Automatically option

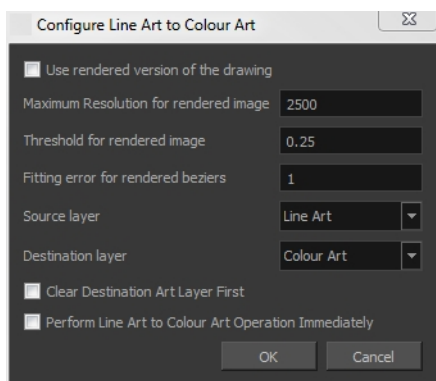

1. In the Tools toolbar, select the Brush tool.
2. In the Tool Properties view, enable the Create Colour Art Automatically  option.
3. Draw the required lines.
4. Once you're done, deselect the Create Colour Art Automatically  option.

You are now ready to paint.

How to configure the Create Colour Art from Line Art option

1. In the Tools toolbar, select the Select  tool or press Alt + S.
2. In the Tool Properties view or the Drawing View toolbar, Shift + click the Create Colour Art from Line Art  button.

The Configure Line Art to Colour Art dialog box opens.

Parameter	Description
Use rendered version of the drawing	Renders the drawing and vectorize it to calculate the position of the centreline that will produce the colour art stroke.
Maximum Resolution for rendered image	The size of the rendered image.
Threshold for rendered image	The value of grey processed to create the rendered vectorized arts.
Fitting error for rendered Beziers	This value represents how precise the fitting of the colour art zone in relation to the line art will be.
Source layer	Lets you select the layer (Line Art, Colour Art, Underlay or Overlay) you want the colour art to be created from.
Destination layer	Lets you select the layer (Line Art, Colour Art, Underlay or Overlay) you want the colour art to be created on.
Clear Destination Art Layer First	Deletes the content before the colour art is added. This is useful when you already have artwork on the destination layer.
Perform Line Art to Colour Art Operation Immediately	Performs the Create Colour Art from Line Art command when you click OK.

Generating a Matte

You can quickly generate a matte to be displayed behind your rough animation so you don't see the background through the drawings. It can be generated in any art layer.

How to generate a matte

1. Do one of the following:
 - In the Tools toolbar, select the Select  tool.
 - Press Alt + S.
2. In the Camera or Drawing view, select the drawing you want to create a matte for.

NOTE: You can also apply the operation to all the drawings in the layer at the same time.

3. Do one of the following:
 - From the top menu, select **Drawing > Generate Auto-Matte**.
 - In the Camera or Drawing menu, select **Drawing > Generate Auto-Matte**.

The Auto-Matte dialog box opens.

4. If you want to create a matte for all the drawings included in your layer, select the **Apply to All Drawings** option.
5. Depending on how precise or rough your line is, increase or decrease the radius value. Use a lower value, the closer to your lines' contours the matte will be shaped. The higher the value, the looser the matte will be shaped.

Radius: 20

Radius: 100

Radius: 300

6. In the Source Art menu, select the layer from which you want the matte created: **Line ArtColour Art**.
7. In the Destination Art menu, select the layer on which you want the matte to be created: **Line ArtColour Art**.
8. If you already have artwork on the destination layer and you want the content to be deleted before the matte is added into it, select the **Clear Destination Art First** option.
9. If you want the contour of your lines to be copied as invisible lines in your matte drawing (in case you ever need to keep them for later), select the **Copy Stroke in Destination** option.
10. Click **OK**.

Previewing Drawings

It is a good idea to preview your drawings to check your animation ink and paint, verify that there are no colour mistakes, or to play your animation in real time. You can do this by scrolling through your drawings or pressing F and G. You can also use the Preview option in the Xsheet view.

How to preview drawings from the Xsheet view

1. Save your scene.
2. Do one of the following:
 - From the top menu, select **File > Save**.
 - Click the Save  button.
 - Press Ctrl + S (Windows/Linux) or ⌘ + S (Mac OS X).
3. In the Xsheet view, select the range of drawings or the whole column to preview.
4. In the Xsheet view menu, select **View > Preview Selected Drawings**.
Toon Boom Play opens.
5. In the Play window, press the Play  button to play back your drawings.
6. Select the **Preroll** option to see blank frames at the beginning and end of the animation sequence while looping the playback.

Chapter 6: Timing

When you create hand-drawn animation traditionally or in a paperless environment, it's important to know how to set and modify the timing of your drawings.

In a traditional workflow, the person in charge of the digital exposure sheet reproduces the paper exposure sheet created by the animator. In a paperless workflow, the animator creates and manages their own exposure sheet directly in Harmony without the need for reproduction.

If you're more of a traditional animator, you will probably work with an exposure sheet. If you're a digital animator, you may prefer to work with a timeline to visualize your timing. Harmony offers both.

The Xsheet view displays the digital reproduction of a traditional paper exposure sheet used in hand-drawn animation. You can set the animation sequence's exposure and name the drawings.

The Timeline view is also used to visualize timing, and represents elements and groups of elements as layers.

You can adjust timing in both views; your choice depends on which technique you're accustomed to using. Depending on your working style, some actions may seem preferable to do in one view instead of another. Many of the actions you perform in the Xsheet can also be accomplished in the Timeline. This chapter will often show both techniques. You can choose which one you prefer.

In this chapter, you will learn how to work on your drawing's exposure and length. The exposure and animation paths for symbols are covered in separate chapters.

NOTE: The exposure sheet is not mandatory for cut-out animation. It can be useful for creating characters and parts, but is not really needed for animation and timing. If you plan to work with cut-out animation, you can still learn useful tips by reviewing the section on exposure sheets.

About Scene Length

The length of your scene is dependent on how many drawings you need to expose and for how long. A drawing can be held for several frames to make the action appear slower or for just a few frames to make the action appear faster. When setting the timing for an animation, a lot of adding and removing of frames occur to get the timing just right. This invariably changes the scene length.

Adding and removing frames can be done in the Timeline, Xsheet or through the Scene menu.

Setting Scene Lengths

T-HFND-007-007

You can set the scene length by adding the right number of frames to your scene. You can set the global scene length from the top menu.

In the Xsheet and Timeline view, you can add and remove frames from a scene to edit its length.

How to set the scene length

1. Select **Scene > Scene Length**.

The Set Scene Length dialog box opens.

2. In the Number of Frames field, enter the number of frames needed.

Modifying the Visible Scene Length

In the Timeline view, you can choose to extend or reduce the limit for visible frames.

When you reduce the scene length, the hidden drawings and symbols are not deleted. They're still available if you extend the scene again.

How to modify the scene length in the Timeline view

1. In the Timeline view, drag the scene length bracket:
 - **Right:** To add more frames to your scene.
 - **Left:** To reduce the number of frames in your scene.

Adding Frames to the Middle of a Scene

As you're setting the timing for drawings, you may realize that you need to add extra frames. It is possible to add new frames either before or after any frame in your scene.

How to add frames to the middle of a scene

You can add frames anywhere in the middle of the scene—before or after a selection. If you select a frame row in the Xsheet view, Harmony will add the new frames before or after the selection, depending on your choice.

- Do one of the following:
 - In the Timeline view, select the frame to which you want to add frames before or after.
 - In the Xsheet view, select a frame row.

	Drawing_3	Drawing_2	Drawing_1	Drawing
1	13	15	1	1
2	14		2	
3	1		3	
4			4	
5		1	5	1
6		2	6	
7		3		
8	2	4		

- In the Timeline view, select the frame to which you want to add frames before or after.

- Do one of the following:
 - From the top menu, select **Scene > Frame > Add Frames Before Selection** or **Add Frames After Selection**.
 - In the Xsheet view, right-click and select **Frames > Add Frames Before Selection** or **Add Frames After Selection**.
 - In the Xsheet toolbar, click the Add Frames  button to add frame after your selection.
 - Press Ctrl + G and Ctrl + H (Windows/Linux) or ⌘ + G and Ctrl + H (Mac OS X).

The Add Frames dialog box opens.

- In the Number of Frames to Add field, enter the number of frames needed in the scene.
- Click OK.

Two frames were added
before selected frame

Adding Frames to the Start or End of a Scene

As you're setting the timing for drawings, it is possible to add new frames either the start or end of the scene.

How to add frames at the start or end of a scene

1. In the top menu, select **Scene > Frames > Add Frames at Start** or **Add Frames at End**.

The Add Frames dialog box opens.

2. In the Number of Frames to Add field, enter the number of frames needed in the scene.
3. Click OK.

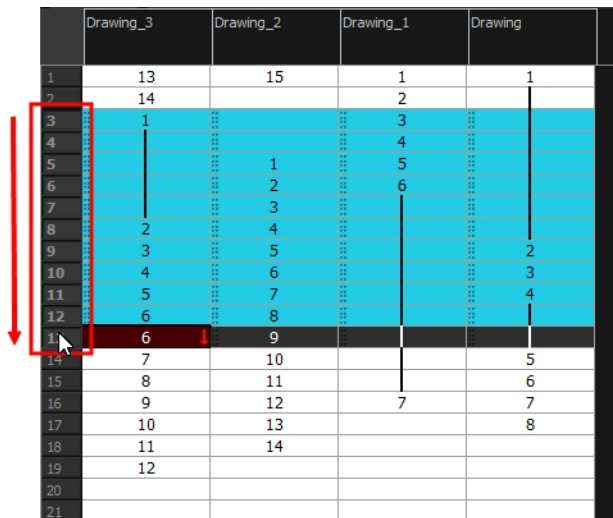

Removing Frames

As you're setting the timing for drawings, it is possible to remove a frame or range of frames.

How to remove a frame or a range of frames in the Xsheet view

In the Xsheet view, you can remove any selected frame range, such as the last frame.

- In the Xsheet view, do one of the following:
 - Select a frame in a given column.
 - Select a frame range by clicking the first frame's number and then dragging the selection highlight down to the last frame to delete.

	Drawing_3	Drawing_2	Drawing_1	Drawing
1	13	15	1	1
2	14		2	1
3	1		3	
4			4	
5		1	5	
6		2	6	
7		3		
8	2	4		
9	3	5		2
10	4	6		3
11	5	7		4
12	6	8		
13	6	9		
14	7	10		5
15	8	11		6
16	9	12	7	7
17	10	13		8
18	11	14		
19	12			
20				
21				

- To delete the selected frames, do one of the following:
 - From the top menu, select **Scene > Frame > Remove Selected Frames**.
 - Press Delete to delete the selection.
 - Click the Remove Frames  button. To remove several frame selections, click the button repeatedly.

If you selected a range of frames, the Warning dialog box may open.

- To complete the operation:

- Click **Yes** to delete the selection.
- Click **No** to delete only the exposure in the cell and not the frames.
- Select the **Don't Show This Message Again** option to prevent the warning message from being displayed each time you delete a frame range.

About Layers and Columns

T-RIG-009-003

Before filling in any values or setting any timing or exposure, you need to create drawing elements. Each drawing element is represented as a vertical column in the Xsheet view and a horizontal layer in the Timeline view.

In Harmony, whether you work in the Timeline or Xsheet view, any modification you do to one view will be applied to both. You can also see your layers displayed in the Node view as nodes.

When you add a drawing element to your scene, a folder is added to the scene directory. This folder is named the same way as the drawing element and is in fact, linked to the drawing element. Its purpose is to contain all the drawings related to this element (layer, column). For example, in cut-out animation, a character can have many heads available. All of the head drawings will be contained in this folder, even if they are not exposed in the Timeline or the Xsheet view.

Drawings are exposed in cells/frames and linked to the drawings saved in the layer's directory. When you remove a drawing from a cell/frame, it is not displayed, but still exists in the directory.

When you create a drawing cycle, all of the repeated drawings are linked to the original files. This means that when you modify, repaint, or correct a drawing named "1," all exposures of drawing "1" are updated simultaneously. In order to modify a drawing independently from its other exposures, you must duplicate the drawing.

NOTE: There are different element types available, such as sound and expression. A sound element contains sound files. Expressions, Beziers, 3D path, Quadmaps and Pegs are for motion purposes during the compositing step. It's not necessary to create these types to create your exposure sheet.

You can add drawing elements from the Timeline view, Xsheet view, and the Scene menu.

NOTE: To learn more about the layer parameters, see the Reference guide .

Layer and Column Types

A column is also known as a layer. There are several types of layers you can add in the Timeline and Xsheet view. Each layer is indicated by an icon to help you differentiate them. Some layers are represented differently in the Xsheet view.

Drawing Layer

The most common layer type is the drawing layer.

Any time you need to create a vector drawing or import a symbol or image, you can use a drawing layer. You can also create bitmap artwork on a drawing layer.

NOTE: Bitmap images are contained in bitmap layers.

Bitmap Layer

If you import a bitmap images (as original bitmap) in your project, they are inserted in a Bitmap layer. If you choose to vectorize your image when you import, the vectorized object will be placed on a Drawing layer.

When importing a bitmap image, you have the option of encapsulating the image in a symbol. If you place a bitmap into a symbol, you will be able to mix vector drawings with it on the same layer.

Camera Layer

You can only have one Camera layer at a time in the Timeline view. By default, there is no Camera layer when you create a scene. You need to add a Camera layer when you want to create a camera motion.

The Camera layer is not visible in the Xsheet view.

NOTE: If you want to have several cameras with different settings, you can keep adding Camera layers in your Timeline view (however, only one will ever be visible at a time as you can only have one camera at a time in your timeline). To switch to a different camera, select **Scene > Camera** and select another camera layer.

Effect Layer

To enhance the look of your scene, you can add effect layers and attach your drawings to them.

When you select the Effect layer in the Timeline view, the effect's parameter columns are displayed in the Functions section of the Xsheet view.

Colour-Card Layer

The Colour-Card layer is used to add a plain colour background to a scene. By default, your scene has no background colour and if you render it as a QuickTime movie or image sequence, it will have a black background.

This layer is not visible in the Xsheet view.

Group Layer

A Group layer can be used to organize the Timeline view.

You can drag and drop other layers onto a Group layer and then collapse the Group layer to hide these other layers from view.

Peg Layer

A Peg layer is a trajectory or motion path layer that does not contain drawings. It can be attached to any drawing layer, cut-out puppet, or other peg layers; they will all follow the trajectory you set in the Peg layer.

When you select the Peg layer in the Timeline view, the peg's function columns are displayed in the Functions section of the Xsheet view.

Quadmap Layer

A Quadmap layer can be described as a deformation transformation layer that does not contain drawings. This can be attached to any drawing layer, cut-out puppet, or even other Peg layers. They will all follow the deformation you set in the Quadmap layer.

When you select the Quadmap layer in the Timeline view, the Quadmap's function columns are displayed in the Functions section of the Xsheet view.

Sound Layer

You can import sound files to add dialog and sound effects to your project. The sound layer will be added to your Timeline and Xsheet view when you import a sound file in your scene.

In the Xsheet view, the Sound layer is a dark grey colour.

Advanced Column Types

In the Xsheet view, you can add several advanced column types to create particular animation paths. When you create these columns, they are not linked automatically to any particular drawing layer. You can create a motion path using these columns and then link or unlink several drawing or peg layers to it.

Advanced column types include:

- Timing
- 3D Path
- 3D Rotation
- Bezier Curve
- Ease Curve
- Expression
- Annotation

Adding Layers and Columns

T-HFND-005-002

There are different ways to add a drawing elements (layers and columns) to your project. By default, when you create a new scene there is one Drawing column in the Xsheet view and one corresponding Drawing layer in the Timeline view.

When you add an element, it will appear as a column in the Xsheet view, a layer in the Timeline view.

NOTE: To learn more about the layer parameters, see the Reference guide .

Adding Layers in the Timeline View

Drawing elements are more commonly known as layers in the Timeline view. Create them using the following procedure:

How to add a drawing element from the Timeline view

1. In the Timeline view, click the Add Drawing Layer  button or press Ctrl + R (Windows/Linux) or ⌘ + R (Mac OS X).

The Add Drawing Layer window opens.

2. In the Name field, name your new layer.
2. Set the Line Art and Colour Art options to **Vector** to get a vector layer or to **Bitmap** to have a bitmap layer.
3. Do one of the following:
 - Click **Add** to add a first layer and keep the window open to add more layers.
 - Click **Add and Close** to add a new layer and close the window.

A new drawing layer is added to the Timeline view.

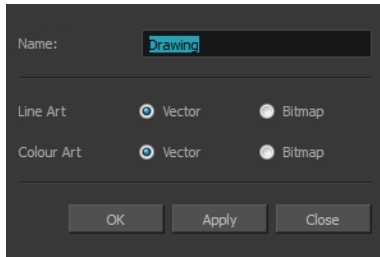

Adding Layers from the Top Menu

Another way to add layers to the Timeline view is through the top menu.

How to add a drawing element from the top menu

1. From the top menu, select **Insert > Drawing**.

The Add Drawing Layer dialog box opens.

2. In the Name field, type a relevant element name and click **OK**.

The new drawing element appears in your scene.

Adding Columns from the Xsheet View

Drawing elements in the Xsheet view are more commonly known as columns. You can add columns using the following procedure:

How to add a drawing element from the Xsheet view

1. Do one of the following:
 - In the Xsheet menu, select **Columns > Add Columns**.
 - Click the Add Columns  button.
 - Press Shift + C.

The Add Column dialog box opens.

2. In the Name field, type a relevant element name.

3. In the Type field, select **Drawing**.

4. To complete the operation:
 - Click **Add and Close** to add your new layers and close the dialog box.
 - Click **Add** to add your new layers and keep the dialog box open to add column.
 - Click **Close** to cancel the operation.

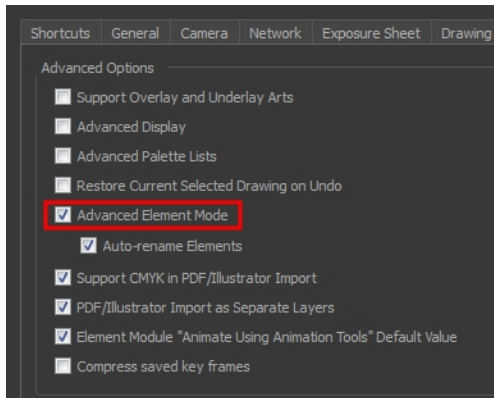

The new drawing element appears in the Timeline, Xsheet and Node views—see [Layer and Column Types on page 347](#).

Using the Advanced Add Column Dialog Box

How to create a column using the advanced Add Column dialog box

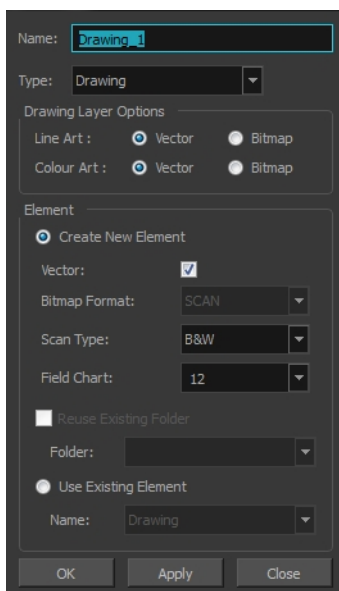

You can use the advanced Add Column dialog box to make more file format and field size options available when you insert a column.

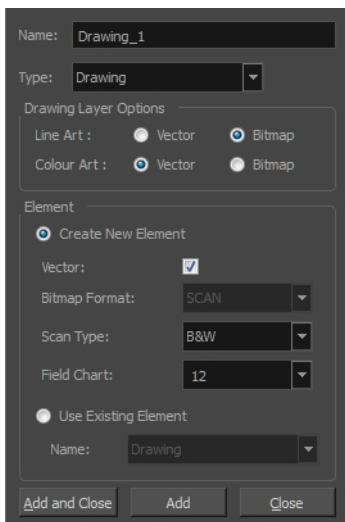

1. From the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences (Mac OS X)** and select the **Advanced** tab.
2. In the Advanced Options section, select the **Advanced Element Mode** option to access the advanced Add Column dialog box.

3. Click **OK**.
4. In the Xsheet menu, select **Columns > Add Column** or press **Shift + C**.

The Add Column dialog box opens.

5. In the Name field, type the new column's name.
6. In the Type menu, select the Drawing type.
7. In the Element section, select one of the following:
 - **Create New Element:** Creates an independent column with its own drawing folder.
 - **Use Existing Element:** Uses drawings from an existing column in the new column. Both columns will be attached to the same set of drawings, but their timing will remain independent from one another. If you modify one of the drawings, it will be modified in both columns. This is the same principle as the Clone column.

In the Name menu, select the column to which you want to link your new column.

8. If you selected the Create New Element option:
 - Deselect the **Vector** option if you want your layer to contain bitmap images or enable it if you want the layer to contain vector drawings. Most of the time, the Vector option will be enabled.
 - If you deselected the **Vector** option, from the **Bitmap Format** list, select which type of bitmap image you want to insert in the column. Select the **SCAN** type if you are planning to scan drawings using the Toon Boom Harmony Scan module.
 - If you deselected the **Vector** option and you chose the **SCAN** type, from the Scan Type menu, select what kind of scanning you want to achieve.

- In the **Field Chart** field, when importing traditional animation, indicate the size of paper on which the animation or background was drawn. If you are not using perforated animation paper, leave the 12 field default value as is.
9. Do one of the following:
- Click **OK** to create the new column and close the dialog box.
 - Click **Apply** to create the new column but keep the dialog box opened to create other new columns.

Deleting Layers and Columns

T-HFND-005-004

You can delete an element in the Timeline view or Xsheet view.

How to delete layers in the Timeline view

1. In the Timeline view, select the layers to delete.

2. Do one of the following:
 - In the Timeline's Layer toolbar, click the Delete Layers button.
 - Right-click on the selection and select **Delete**.

How to delete columns in the Xsheet view

1. In the Xsheet view, select the columns to be deleted by clicking on their header.

2. Do one of the following
 - Right-click on the selection and select **Delete Columns**.
 - In the Xsheet toolbar, click the Delete Columns button.
 - Press Delete.

The Confirm Delete dialog box opens.

- Select the **Delete Drawing Files and Element Folder** option if you want to delete the drawings and folders linked to the selected column.

3. To complete the operation:

- Click **OK** to delete the selected layers.
- Click **Cancel** to cancel the operation.

The Warning dialog box may open.

4. Do one of the following:
 - Click **Yes** to delete all the frames from your scene.
 - Click **No** to keep the frames in your scene.
 - Select the **Don't Show This Message Again** option if you do not want the dialog box to display again in the future.

Renaming Layers and Columns

Once you add layers and columns to your project, you can modify their names.

How to rename a layer in the Timeline view

1. In the Timeline view, double-click on the name of the layer to rename.
2. In the Name field, rename the layer and press Enter/Return.

How to rename a layer in the Layer Properties editor

1. In the Timeline view, double-click anywhere on the layer except the layer name to rename.
The Layer Properties editor opens.
2. In the Name field, rename the layer.

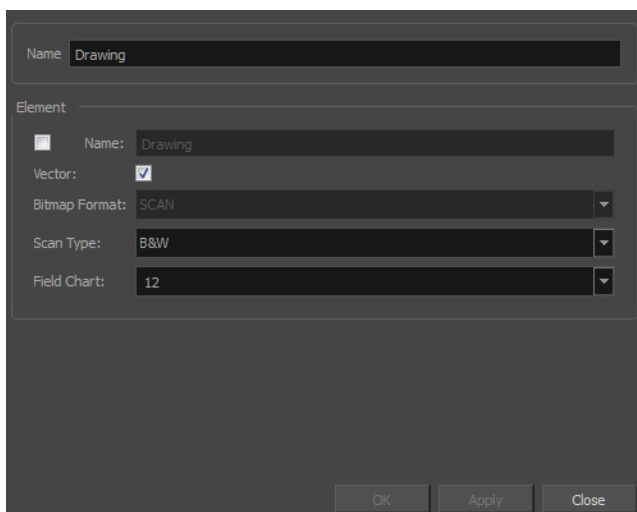

3. Click **Close**.

How to rename a column

1. In the Xsheet view, double-click on a column name. Do not click on the drawing folder name that the column is linked to (this also appears in the column header just below the column name).

The Drawing dialog box opens.

-
2. In the Name field, rename the column.
3. Click **OK**.

About Layer and Column Display

You can change the way a column in the Xsheet view displays. You can change the way a layer in the Timeline view or a column in the Xsheet view displays. You can stay organized without changing the content of elements or your animation output.

Expanding and Collapsing Layers and Columns

To simplify the look of the Timeline or Xsheet view, you can expand and collapse some of the layers and columns. If layers are parented to other ones, you can collapse the parent layer to hide its children.

How to collapse or expand selected layers in the Timeline view

1. In the Timeline view, select the layer(s) to collapse or expand.
2. Do one of the following:
 - Right-click on the selection and select **Collapse/Expand > Collapse/Expand**.
 - Click the Expand Children Arrow  button on the parent layer.
 - Click the Collapse/Expand  button (you may have to customize the toolbar to display it).
 - Press Ctrl + I (Windows/Linux) or ⌘ + I (Mac OS X).

How to collapse or expand all layers in the Timeline view

1. Do one of the following:
 - Right-click on the layers and select **Collapse/Expand > Expand All** or **Collapse All**.
 - In the Timeline toolbar, click the Collapse All  or Expand All  buttons (you may have to customize the toolbar to display them).
 - Press 0 and 9.

How to collapse and expand 3D path or rotation columns in the Xsheet view

1. In the Xsheet toolbar, click the Show Column List  button to display the Functions list.
2. In the Xsheet view, select the column header of the 3D path or 3D rotation column to collapse or expand.
3. Do one of the following:
 - Right-click on the column's header and select **Expand/Collapse > Collapse Selection** or **Expand Selection**.
 - In the Xsheet toolbar, click the Collapse Selection  or Expand Selection  buttons (you may have to customize the toolbar to display it).

How to collapse or expand all 3D path and 3D rotation columns in the Xsheet view

Do one of the following:

- Right-click on any column's header and select **Expand/Collapse > Collapse All** or **Expand All**.
- Press 0 and 9.
- In the Xsheet toolbar, click the Collapse All  or Expand All  buttons (you may have to customize the toolbar to display it).

Showing and Hiding Layers and Columns

As you work in the Drawing, Camera or Xsheet view, some layers or columns may be in the way, such as those that were used as references. You can hide these layers to make your work area less cluttered and easier to navigate.

Showing and Hiding Layers

T-HFND-005-010

You can show and hide layers in the Timeline view in several different ways.

When using the Solo mode to show or hide layers, here's how it works:

- If you have anything selected, it is not affected.
- When multiple layers are selected and you enable/disable the Solo mode on any of those layers, it is applied to all the selected layers.
- When multiple layers are selected and you enable/disable the Solo mode on layers that are not part of the selection, it is applied only to those particular layers.

When exporting or rendering a scene, the Solo mode setting of layers is ignored.

NOTE: When a layer is affected by an inverted cutter, enabling the Solo mode for this layer will not show it unless the mask is also enabled.

How to show or hide all layers

1. Click one of the following in the Layers toolbar:

- Enable/Disable All  button to show or hide all layers.

Any hidden layers are unhidden, so you can view all layers.

- Solo Mode  button to view disable your current Solo mode selection. Any soloed drawing or sound layers are disabled, so you can view all layers. When you click again on the Solo Mode button, you last Solo selection is displayed.

How to show or hide individual layers

1. Do one of the following:

- In the Layer toolbar, click the Solo Mode  button.
- Click the layer's Enable/Disable All  button to show or hide that layer.

- Press A to show a layer or D to hide selected layers.

- In the Timeline toolbar, click the Enable/Disable button (you may have to customize the toolbar to display it).

When you deselect a layer in the Timeline view, the corresponding column is hidden in the Xsheet view.

How to enable the selected layer and disable all others

1. Do one of the following:
 - Hold down Alt and click the Solo Mode button of the layer you want to solo and hide all other layers.
 - In the Timeline toolbar, click the Disable All Others button (you may have to customize the toolbar to display it).

How to show and hide layer types in the Timeline view

1. From the Timeline menu, select **View > Show > Show Manager**.

The Show Manager dialog box opens.

2. Select the types of layers you want to display and deselect the ones you want to turn off.
3. Click **Set As Default** to make these new settings the default ones that will be used each time to start the application. Click **Restore Default** to restore the settings used when installing the application.

In the Xsheet view, you have the choice of hiding or showing certain types of columns such as Annotation and Functions.

In the Timeline view, you can hide or show certain types of layers such as Effect.

Showing and Hiding Columns

The Xsheet view has a Column List section that displays all the columns contained in the exposure sheet. It can be used to hide individual columns.

If you need to see a column after it has been hidden, you can display it directly from the Xsheet view without using the Column List section.

You can also hide a column type, such as Drawing or Sound. When you do this, its corresponding layer is disabled in the Timeline view.

How to show and hide columns in the Xsheet view

1. In the Xsheet toolbar, click the Show Column List  button.
2. On the right side of the Functions section, click the Expand  button to display the Column List section.
3. Do one of the following:
 - In the Column List section, select the columns to display and deselect the columns to hide.
 - In the Xsheet toolbar, click the Hide Selected Column  button (you may have to customize the toolbar to display it).

Showing Hidden Columns

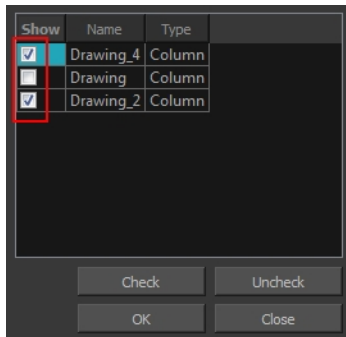

In order to save visual space in the Xsheet view, columns can be hidden from view. The hidden layer's presence is indicated by a thicker grey line between columns.

How to show hidden columns in the Xsheet view

- In the Xsheet view, do one of the following:
 - Click the thick grey line that represents a hidden column.
 - Right-click on the column header and select **Show Hidden Columns**.
 - Press Alt + Shift + H.

The Show Hidden Columns dialog box opens.

- In the Show column, select the hidden columns you want to display in the Xsheet view.
 - Click **Check** to select all the selected columns.
 - Click **Uncheck** to deselect all selected columns.

Showing All Columns

In order to save visual space in the Xsheet view, columns can be hidden from view. You can bring all the hidden columns back into view all at once.

How to show all columns

- In the Xsheet menu, select **View > Unhide All Columns**.

Showing and Hiding Column Types

You can hide specific column types from view, in order to work more easily with one aspect of your project. For example, you could hide all the Drawing columns in the Xsheet, so that you could work more easily with your 3D Path Columns.

How to show and hide column types using the Column List

1. In the Column List section, click the button corresponding to the column type you want to show or hide.

Column Type	Action
	Show/Hide All Columns
	Show/Hide Drawing Columns
	Show/Hide Function Columns
	Show/Hide 3D Path Columns
	Show/Hide 3D Rotation Columns
	Show/Hide Sound Columns
	Show/Hide Annotation Columns

How to show and hide column types using the Column Types Manager

1. In the Xsheet view, select **View > Column Types Manager**.

The Column Types dialog box opens.

2. Select the types of columns you want to display and disable the ones you want to hide.

Click **Set As Default** if you want to make these new settings the default ones used each time you start Harmony.

Click **Restore Default** if you want to return the settings to their defaults.

Customizing the Column Appearance

In Harmony, you can customize the way the column displays drawings, empty cells and the column width.

You can modify the following elements:

- Empty cells
- Row units
- Held exposure
- Column width

How to change the appearance of an empty cell

1. From the Xsheet menu, select **View > Empty Cells > With an "X" or Blank**.

How to modify row units

1. From the Xsheet menu, select **View > Row Units > Frames or Feet**.

How to modify the look of a held exposure

1. In the Xsheet menu, select **View > Held Exposures > Line or Value**.

How to modify column width

1. In the Xsheet view, select a column.
2. From the Xsheet menu, select **View > Set Columns Width**.

The Xsheet Column Width dialog box opens.

3. In the Column Width field, enter the desired width in pixels.
4. Do one of the following:
 - Click **OK** to validate and close the dialog box.
 - Click **Apply** to validate the operation and keep the dialog box opened to adjust the next column's width.
 - Click **Set As Default** to create all the new columns to this width.
 - Click **Close** to cancel the operation.
5. To restore all columns to the default value, in the Xsheet menu, select **View > All Columns to Default Width**.

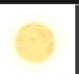

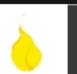

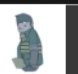

Displaying Xsheet Thumbnails

When there are a large number of columns in the exposure sheet, it's not easy to quickly identify a particular column. Displaying the column thumbnails makes this easier. This option displays a small thumbnail picture of the current frame below the column header.

How to display the thumbnails

- Do one of the following:
 - In the Xsheet toolbar, click the Show Thumbnails  button.
 - In the Xsheet menu, select **View > Show Thumbnails**.

The thumbnails appear.

	Bg_Camp	Moon Scene_3	Stars Scene_2	Sky Scene	Fire_Colo	Lumberjack_D_F Lumberjack_D_C
						
1	Camp	Moon	Stars	Sky	1	1
2						
3					2	2

Changing Layer and Column Colours

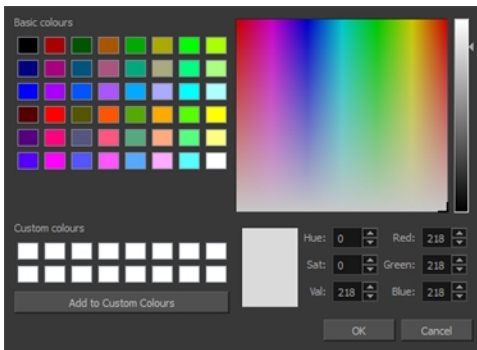

To easily identify elements in the Timeline or Xsheet view, you can change the colour of layers and columns.

How to change the layer's colour in the Timeline view

1. In the Timeline view, click the Change Track Colour  button of the layer you want to modify.

2. In the Select Colour dialog box, select a new colour for your layer.

3. Click **OK**.

The layer's background colour is updated. In a Drawing layer, exposed cells are the brighter, selected colour for easy identification. The corresponding column colour is also updated in the Xsheet.

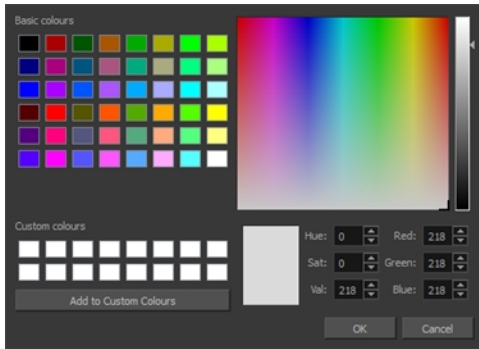

How to reset a layer's colour in the Timeline view

1. In the Timeline view, select the layers to reset.
2. In the Timeline toolbar, click the Default Track Colour  button (you may have to customize the toolbar to display it).

How to change a column's colour in the Xsheet view

1. In the Xsheet view, select one or more columns to modify.
2. Right-click on the column's header and select **Colour > Change Columns Colour**.
3. In the Select Colour dialog box, select a new colour for your columns.

4. Click **OK**.

The column's colour is updated. The corresponding column colour is also updated.

	Plant_000	Tower_000	Tower2_000	Moon
1	1	1	1	1
2				
3				
4				
5				
6				
7				
8				
9				

How to reset the column's colour in the Xsheet view

1. In the Xsheet view, select the columns to reset.
2. Right-click on the column's header and select **Colour > Default Columns Colour**.

About Scene Markers

Scene markers are visual indicators displayed at the top of the Timeline view in the frame counter area. You can use it to denote anything relevant to your work. You can indicate the frames you want to clean up, a change in action, an impact, or where you intend to apply an effect. You can also add a note to a scene marker, which is displayed when you hover over the scene marker.

There are two ways to add a scene marker. You can mark the current frame or make a frame range selection and mark the whole section.

Creating Scene Markers on Current Frames

Change the colour of the area above a frame by setting a scene marker. This will allow you to find the frame more rapidly when quickly scanning the Timeline.

How to mark the current frame

1. In the Timeline view, make sure the red playhead is set on the frame you want to mark. Even if you right-click on a different frame, the scene marker will be created on the current frame on which the playhead is positioned.
2. Right-click in the frame counter area and select **Scene Markers > Mark Current Frame**.

The Timeline Scene Marker dialog box opens. The Colour box displays a black colour swatch, or the colour of the last scene marker you created.

3. Click the Colour switch to open the Marker Colour dialog box and select a colour for the scene marker. Click **OK**.

4. In the Note field, enter descriptive or title text and click **OK**. This text will appear in the tooltip when you hover your mouse over the scene marker.

In the Timeline view, the scene marker is displayed at the current frame.

5. Hover over the scene marker to display its tooltip.

Creating Scene Markers on Frame Ranges

Change the colour of the area above a frame range by setting a scene marker. This will allow you to find the range more rapidly when quickly scanning the Timeline.

How to create a scene marker on a frame range

1. In the frame counter area, select the frame range you want to mark.

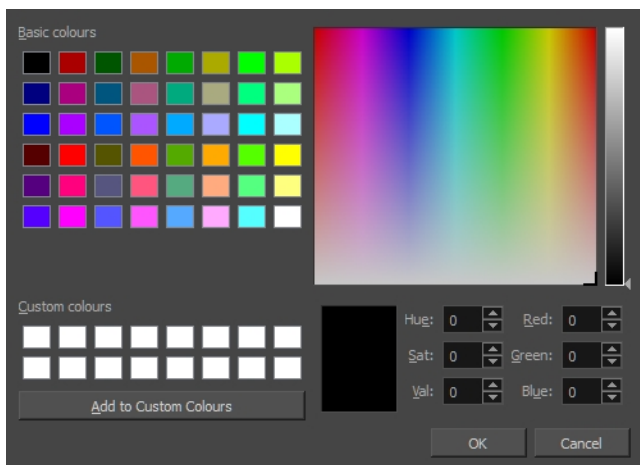

2. Right-click and select **Create Scene Marker**.

The Timeline Scene Marker dialog box opens. The Colour box displays a black colour swatch, or the colour of the last scene marker you created.

3. Click the Colour swatch to open the Marker Colour dialog box and select a colour for the scene marker. Click **OK**.

4. In the Note field, enter descriptive or title text and click **OK**. This text will appear in the tooltip when you hover your mouse over the scene marker.

In the Timeline view, the scene marker is displayed over the selected frame counters.

5. Hover over the scene marker to display its tooltip.

Editing Scene Markers

You can modify the colour of a scene marker or edit the note attached to it.

How to edit a scene marker

1. In the frame counter area, select the entire scene marker.

NOTE: It's important to select the entire length of the scene marker, otherwise the Timeline Scene Marker dialog box will not open for editing.

2. Right-click and select **Scene Markers > Edit Scene Marker**.

The Timeline Scene Marker dialog box opens.

3. Make your changes.
4. Click **OK**.

Deleting Scene Markers

If you deem it no longer necessary to have a frame or a range of frames marked, you can delete the scene marker.

How to delete a scene marker

1. In the frame counter area, select at least one frame in the scene marker you want to delete.

2. Right-click and select **Scene Markers > Delete Scene Marker**.

Setting Tempo Markers

Tempo markers are used to synchronize your animation with a musical score. This lets you reproduce the FPB (Frames Per Beat) and use the tempo signature as tempo markers. The Xsheet view lets you pace your animation according to the tempo or beat of the soundtrack music or to any rhythmic sound, such as the ticking of a clock or water leaking from a spout.

How to set the tempo markers

1. In the Xsheet menu, select **View > Set Tempo Marker**.

The Tempo Marker dialog box opens.

2. Reproduce the tempo and beat value of your music or sound for the Xsheet view marker display.
 - ▶ **Starting Frame:** Enter the number of the frame where you want the tempo markers to begin.

- **Frames/Beat:** Set the frames per beat value. This will determine the frequency (in frames) in which a beat marker will appear. Keep in mind that, by default, 24 frames represent 1 second.
 - **Beat/Bar:** Set the tempo of your music or sound. This will determine the frequency (in beats) in which a tempo marker will appear in the Xsheet view.
3. Click **OK**.

Reordering Layers and Columns

You can change the order of your elements in the Timeline view and Xsheet view. When you change the order of your elements in one view, the other one is updated.

How to reorder layers in the Timeline view

1. In the Timeline view, select the layers to move.
2. Drag the selection to the new location.
3. Do one of the following:
 - Drop the selection on an existing layer to make it a child of another element layer.
 - Drop it between the existing layers. Timeline layers that are located above the selection are displayed in front it. Layers located under it in the Timeline View are displayed behind it.

How to reorder columns in the Xsheet view

1. In the Xsheet view, click on the column's header with the middle mouse button.
2. Drag the column to its new position.

Navigating Layers and Columns

Once a cell is selected in the Timeline or Xsheet view, you can navigate between the drawings, frames, and layers. Displays the previous drawing, next drawing, previous layer or next layer. using keyboard shortcuts that work in the Camera, Drawing, Xsheet and Timeline views.

You can navigate through:

- Drawings
- Frames
- Columns

How to navigate through drawings, and frames and columns

1. In the Timeline or Xsheet view, select a cell.

2. Once the cell is selected, you can navigate between:

- **Previous and next layers:** From the top menu, select **Drawing > Previous Layer** and **Next Layer** or press H and J.

- **Previous and next drawings:** From the top menu, select **Drawing > Previous Drawing** and **Next Drawing** or press F and G..

- **Previous and next frames:** From the top menu, select **Play > Previous Frame and Next Frame** or press comma (,) and period (.)

Duplicating Layers and Columns

Duplicating an element provides you with a copy of the drawings and their exposure. You can modify anything you want in the duplicated element without affecting the original one.

How to duplicate an element

1. In the Timeline or Xsheet view, click the layer or column to duplicate.

2. Do one of the following:
 - (Xsheet) Right-click on the column and select **Duplicate Selected Columns**.
 - (Xsheet) In the Xsheet menu, select **Drawings > Duplicate Drawings**.
 - (Timeline) Right-click on the layer and select **Duplicate Selected Layers**.
 - (Timeline) In the Timeline menu, select **Layers > Duplicate Selected Layers**.

The new duplicated layer or column appears.

Cloning Layers and Columns

Cloning a layer or column provides you with a copy of the selected element that uses the same drawings as the original. For example, if you modify a drawing in the cloned or original column, it is updated in both columns.

You can choose whether or not to copy the column timing to the cloned columns.

- You can modify the column timing independently from each other, but the drawings remain linked.
- You can copy the columns timing, so drawings and timings remain linked.

You can clone selected nodes from the Node view in the same way.

This is useful when you want to reuse a hand-drawn animation but have different timings.

How to clone an element

1. In the Timeline or Xsheet view, select the layer or column to clone.

2. Do one of the following:

- From the top menu, select **Edit > Clone: Drawings Only** to clone only the layer or column drawings.
- From the Timeline menu, select **Layers > Clone Selected Layers: Drawings Only**.
- From the Xsheet menu, select **Columns: Clone Selected Columns: Drawings Only**.

The new cloned layer or column appears.

About Sync Layers

Use the Sync Layer feature when you need drawings to be separated on different layers, but to have the same timing, such as with the front and back of a shirt collar. The drawing exposures of synced layers not only update automatically, but their drawing substitutions correspond as well, as long as the drawings are labeled properly.

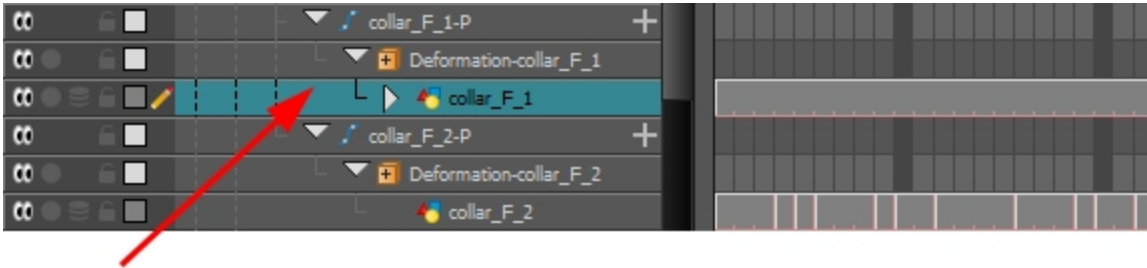

When using certain drawing tools, such as the Select, Cutter and Reposition All Drawings tools, you can enable the Apply to Synced Drawings option while you work. To learn more about this option—see the Reference .

Syncing Two Layers

The Sync Layer feature allows for drawings to be separated on different layers, but to have the same timing.

How to sync two layers

1. In the Timeline view, right-click on the drawing layer you would like to sync with another layer.

2. From the right-click menu, select **Sync Layers With**.
The Convert to Synced Drawing Layer dialog box opens.

3. From the drop-down list, select a parent drawing layer to sync with the currently selected layer.
4. Click OK.

In the Timeline view, when you click on either of the two synced layers, the other will display the link icon.

In the right side of the Timeline view, the child layer will update to the parent layer's timing.

5. In the Timeline or Xsheet view, change the drawing exposure or substitute drawings in either of the two layers.

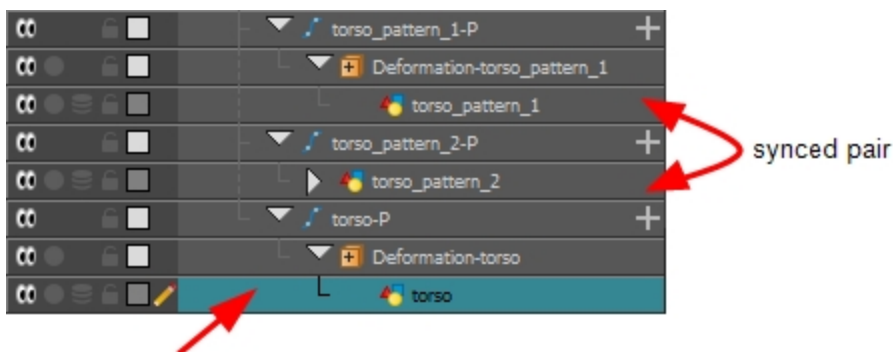

The other synced layer immediately updates to the same timing.

Syncing Multiple Layers

You may want to sync more than two layers. However, once a layer is synced, the Sync Layers menu option becomes disabled for that layer. In order to sync a layer to a layer that has already been synced, you need to use the Sync Layers command on the yet unsynced layer.

How to sync multiple layers

1. In the Timeline view, right-click on the drawing layer you would like to sync with an already synced pair.

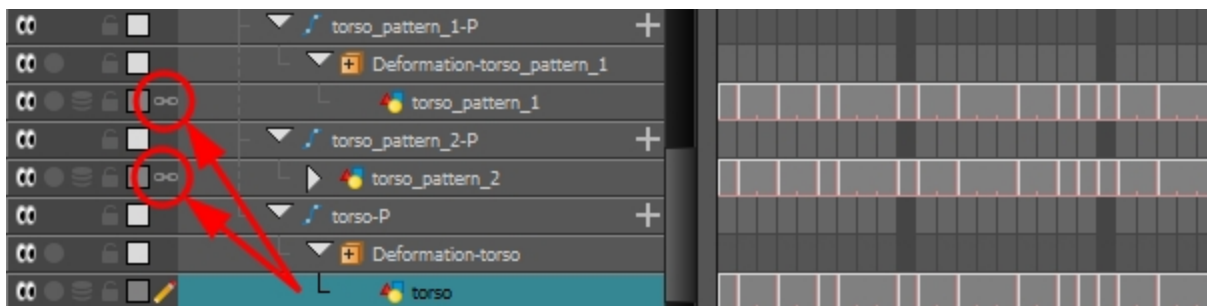

2. From the right-click menu, select **Sync Layers With**.
The Convert to Synced Drawing Layer dialog box opens.

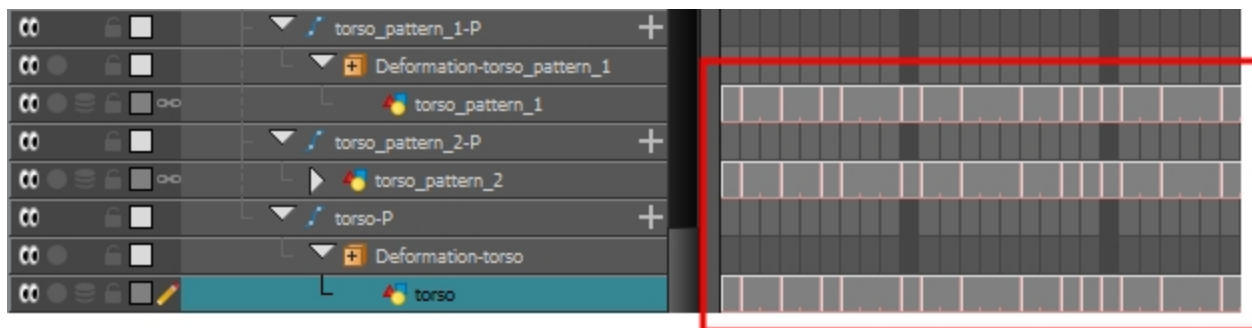

3. From the drop-down list, select the parent drawing layer you would like to sync with the currently selected layer. This should be a drawing layer already synced with another drawing layer. You can select either the parent or the child from that linked pair; they both appear in the drop-down list.
4. Click OK.

In the Timeline view, when you click on any of the synced layers, the others will display the link icon.

In the right side of the Timeline view, the child layer will update to the parent layer's timing.

5. In the Timeline or Xsheet view, change the drawing exposure or substitute drawings in any of the synced layers.

The other synced layers immediately update to the same timing.

Creating Synced Layers

Create a new drawing layer to be synced immediately with an existing drawing layer.

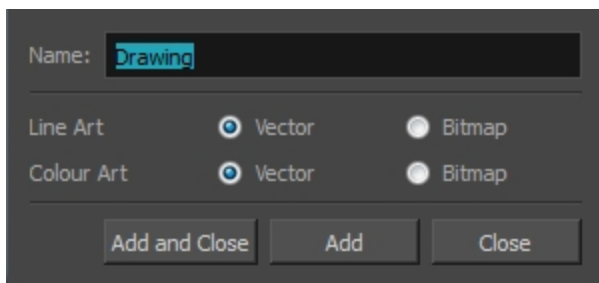

How to create a new synced layer

1. In the Timeline view, right-click on the drawing layer you would like to sync with another layer.

2. From the right-click menu, select **Add Synced Drawing Layer**.

The Add Synced Drawing Layer dialog box opens.

3. In the Add Synced Drawing Layer dialog box, add a single or multiple drawing layers.
4. When you are finished, click Close.

In the Timeline view, when you click on any of the synced layers, the others will display the link icon.

In the right side of the Timeline view, the child layer will update to the parent layer's timing.

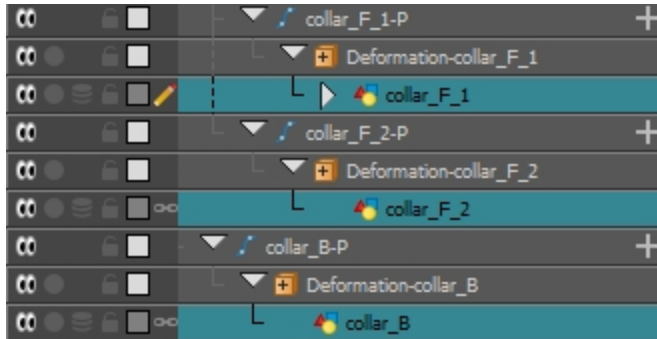

Selecting All Synced Layers

You can select all the drawing layers that are linked to the selected drawing layer, in the Timeline view.

How to select all synced layers

1. In the Timeline view, select a layer that is synced to at least one or more layer.
2. In the view menu , select **Edit > Select Synced Layers**.

In the Timeline view, all the layers synced to the selected layer become highlighted.

Unsyncing Layers

Once layers have been synced, they can just as easily be unsynced.

How to unsync layers

1. In the Timeline view, right-click on the child layer of a synced pairing.
2. From the right-click menu, select **Unsync Layer**.

The parent layer is unsynced and the link icons disappears.

NOTE: If this menu item is disabled, then the selected layer is either the parent layer or a layer that is already unsynced.

About Annotation Columns

T-ANIMPA-005-001

The annotation columns are useful for marking actions, corrections or other information related to your animation that you want to draw or write. This way, you can print your Xsheet, take it back to your animation table and work with the annotations.

Before you can draw in the Annotation column, you must first activate the Enable Drawing option to activate the Drawing mode. Pen tablet pressure sensitivity is not supported in the annotation column.

Adding Annotation Columns

T-ANIMPA-005-002

Add annotation columns to mark actions, corrections or other information related to your animation.

How to add an annotation column

1. Do one of the following:
 - In the Xsheet menu, select **Columns > Add Columns**.
 - In the Xsheet toolbar, click the **Add Columns**  button.
 - Press Shift + C.

The Add Column dialog box opens.

2. In the Name field, type in an appropriate name.
3. From the Type list, select **Annotation** and click OK.

The new column appears.

Drawing in Annotation Columns

T-ANIMPA-005-003

In the annotation column, you can draw sketches and ideas that will be useful in producing your animation.

How to draw in the annotation column

1. Do one of the following:
 - ▶ In the Xsheet menu, select **Annotation > Enable Drawing**.
 - ▶ In the Annotation column header, click the icon in the upper-right corner to cycle through the icons until the Brush  icon is displayed.

The Drawing mode is enabled.

2. To draw in an Annotation column, simply use your mouse or pen tablet.

Typing in Annotation Columns

T-ANIMPA-005-004

In the annotation column, you can type in your notes and relevant information that will be useful in producing your animation.

Typing in an annotation column is independent from the Drawing mode. You can be in either mode and the typing will work. To learn about typing values in the Xsheet view, see [Typing Exposures on page 411](#).

How to type in an annotation column

1. Do one of the following:
 - In the selected cell, press Ctrl (Windows/Linux) or ⌘ (Mac OS X).
 - In the selected cell, hold down Ctrl + Shift + click (Windows/Linux) or ⌘ + Shift + click (Mac OS X).

2. In the selected cell, type the desired text.

Erasing in Annotation Columns

T-ANIMPA-005-005

You can erase part or all of the annotation column's text and drawn annotations. Annotations that you type in cannot be erased using this method.

How to erase part of a drawn annotation using Erasing mode

1. In the annotation column header, click the icon in the upper-right corner to cycle through the icons until the Eraser  icon is displayed.
2. In the column, click and drag the cursor on top of the drawn annotation to erase parts of it.

NOTE: When using a pen on a tablet, you **MUST** flip your pen to the eraser side for the eraser to work.

Modifying Annotation Column Pen Options

T-ANIMPA-005-006

You can change the pen size and colour when you draw in the annotation column.

How to modify the pen width

1. In the Xsheet menu, select **Annotation > Pen Width** and do one of the following:
 - Select a pen width preset.
 - Select **Change Current** to display the Pen Width dialog box. In the Pen Width field, type the number of pixels for the pen size and click **OK**.

How to modify the pen colour

1. In the Xsheet menu, select **Annotation > Change Pen Colour**.

The Select Colour dialog box opens.

2. Choose a new colour.
3. Click **OK**.

Showing and Hiding Annotation Column Tick Marks

T-ANIMPA-005-007

When working with the annotation columns, it is useful to display tick marks on odd-numbered frames.

shadow_d	Lumberjack_D_Colo	Lumberjack_D_Colo	bench_matte_D_1	Annotation
1	1	1	1	
2	2	2		
3	3			
1	1			
2	2			
3	3			
1	1			
2	2			
3	3			
1	1			
2	2			
3	3			
1	1			
2	2			

Tick marks in Annotation column

To display the tick marks, you must run a short script.

How to display tick marks

1. From the top menu, select **Windows > Script Editor**.
2. From the Script Editor menu, select **File > New Script**.
3. Type in a name for your script and click **OK**.
4. In the File list, select the script you created.
5. On the right side of the view, type the following script:

```
function display_tick_marks()
{
  preferences.setBool("XSHEET_ANNOTATION_FRAME_MARKER", true);
  MessageLog.trace(preferences.getBool("XSHEET_ANNOTATION_FRAME_MARKER", false));
}
```

6. Click **Verify**.

The script is verified.

7. From the Script Editor menu, select **Play/Debug > Run**.

A dialog box opens with your script selected in the Files column.

8. In the Functions column, select **display_tick_marks** and click **OK**.

Tick marks appear on odd frames in the Annotation column. If you do not see tick marks, close and restart Harmony.

How to turn off the display of tick marks

1. Follow steps 1 to 5 of *How to display tick marks* and use the following script:

```
{  
preferences.setBool("XSHEET_ANNOTATION_FRAME_MARKER", false);  
MessageLog.trace(preferences.getBool("XSHEET_ANNOTATION_FRAME_MARKER", false));  
}
```

2. Follow steps 6 to 8.

All tick marks are removed from the Annotation column.

Importing Annotation Files

If you scanned your paper exposure sheet's annotations or if you need to place some pictures or drawings in the Annotation columns, you can easily import them.

How to import annotation files

1. In the Xsheet view, select the first cell in the Annotation column where you want the imported image to start.

2. Do one of the following:
 - Right-click on the cell and select **Annotation > Import File**.
 - From the Xsheet menu, select **Annotation > Import File**.
3. Browse for the bitmap image to import.
4. Click **Open**.

The image appears in the Annotation column.

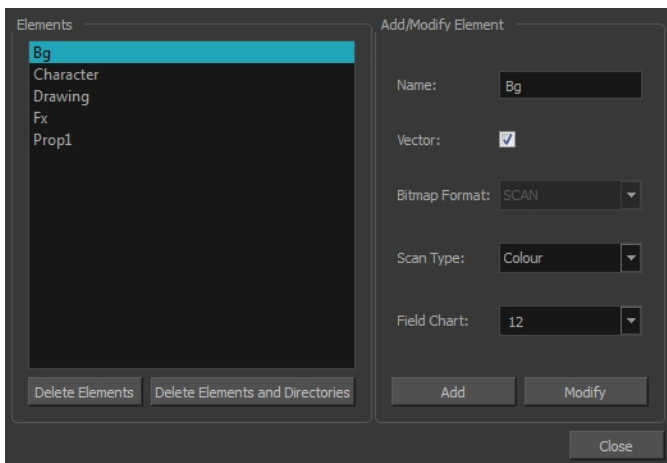

Using the Element Manager

The Element Manager window lets you Open the Element Manager window where you can add, delete or modify elements (drawing folders) in your scene. If you have drawing folders that are not linked to a column in your scene, use the Element Manager to delete them if needed. See [xref Reference > Windows > Element Manager](#).

How to use the Element Manager

- From the top menu, select **Scene > Element Manager**.—see the Reference guide .

Displaying Layer and Column Properties

Each element has its own set of properties that you can modify, including effect and peg layers.

If you want to modify an element's properties, you can display the properties of a selected layer in the Timeline view or selected node in the Node view. If you're working with the Xsheet, you can display its properties as well. You can display a layer's properties as a window or as a view of its own.

The Layer Properties editor allows you to:

- Rename the layer
- Enable or disable the layer
- Lock the layer
- Change the track colour
- Activate the onion skin preview
- Adjust the positioning and animation parameters
- Adjust many other advanced parameters

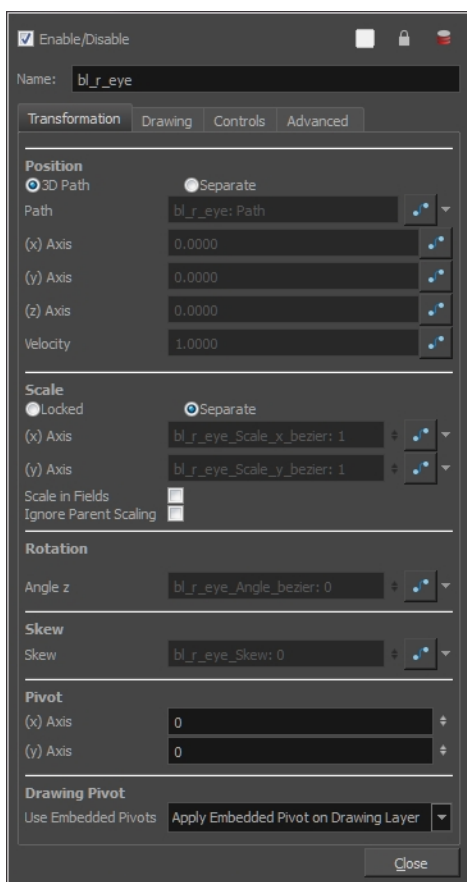

The Column Properties editor allows you to:

- Rename the layer
- Enable or disable the layer

How to display a layer's properties

1. Do one of the following:
 - In the Layer Properties view is not part of your workspace, from the top menu, select **Windows > Layer Properties**. In the Timeline view, select a layer
 - In the Timeline view, double-click on a layer.
 - Press Shift + E.

The properties display—see Element/Drawing Node in the Reference guide .

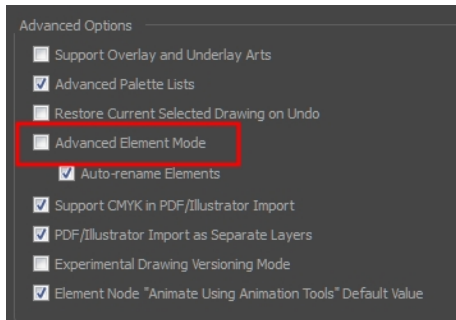

How to display a column's properties in the Xsheet view

1. In the Xsheet view, do one of the following:
 - Double-click on a column header.
 - Right-click on a column header and select **Column Editor**.

The properties for the column are displayed.

2. (Optional) To view additional properties, select **Edit > Preferences** from the top menu.
3. In the Preferences dialog box, select the **Advanced** tab, then select the **Advanced Element Mode** option.

4. In the Xsheet view, double-click on a column header.

Additional properties for the column are displayed.

About Exposures

Harmony provides different ways to fill in exposures and values, create cycles, and set increments.

Inserting and Overwriting Exposures

In the Xsheet view, you can fill columns using two different filling modes: Overwrite or Insert. These modes control the filling behaviour. The Timeline view only uses the Overwrite mode.

By default, the Xsheet view is set to Overwrite mode. Adding a new value or a new value sequence overwrites existing ones. The existing timing sequence remains in the same place and is not pushed down the column.

	Drawing	Drawing
1	1	1
2	2	2
3	3	3
4	4	4
5	5	7
6	6	8
7	7	9
8	8	10
9	9	11
10	10	12
11		
12		

The Insert mode is the opposite of the Overwrite mode. When you add a new value or a new value sequence over existing ones, the new values are inserted between the old ones. The existing timing sequence is pushed down the column.

	Drawing	Drawing
1	1	1
2	2	2
3	3	3
4	4	100
5	5	
6	6	
7	7	
8	8	100
9	9	4
10	10	5
11		6
12		7
13		8
14		9
15		10

How to switch between the Overwrite and Insert modes

- Do one of the following:
 - In the bottom-right corner of the Xsheet view, click **Overwrite/Insert**.
 - Press **I**.

Typing Exposures

T-HFND-006-007

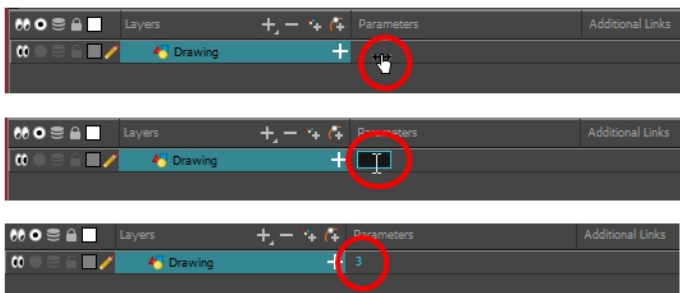

To fill in your exposure, you can type the values directly in the Xsheet view.

If you want to type an exact drawing name or value in the Timeline view, you must use the Parameters section of the Timeline.

NOTE: You can only use alphanumeric values (0 to 9, a to z) and the underscore (_) and dash (-).

How to type a value in the Timeline view

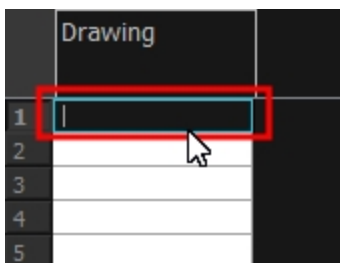

1. In the Drawing Substitution field, double-click to edit the field and type the name of the drawing you want to create.

2. Press Enter/Return to validate the value.

How to type a value in the Xsheet view

1. In an Xsheet column, double-click on a cell.

2. Type a value or drawing name in the cell.

3. Press Enter/Return to move to the next cell.

4. Press Esc to exit the typing mode.

Holding Exposures

Drawings in an animation project are often exposed for more than one frame. The most common exposure of a drawing is two frames. In the industry, this type of exposure is known as *animation in double frames* or *animation on twos*. A drawing can also be exposed for three, four, or five cells and so on. To prevent mistakes and save time, you can hold cells automatically as you type in the Xsheet view.

How to hold an exposure

1. Do one of the following:
 - ▶ In the Xsheet menu, select **Exposure > Hold Exposure > Hold 2 Cells**.
 - ▶ From the top menu, select **Animation > Cell > Hold Exposure > the desired option**.
2. Type a value or drawing name in the cell.
 - ▶ Press Enter/Return to move on to the next cell.
 - ▶ Press Esc to quit the typing mode.

Extending Single Exposures

T-HFND-007-008

Extending the exposure lets you select a cell and extend it to the desired frame.

How to extend an exposure in the Timeline view

1. In the Timeline view, select the cell you want to extend.
2. Do one of the following:
 - Right-click and select **Extend Exposure**.
 - In the Timeline View menu, select **Exposure > Extend Exposure**.
 - Select **Animation > Cell > Extend Exposure**.
 - Press **F5**.
3. In the Extend Exposure dialog box, enter the frame number to extend your cell to.
4. Indicate if you want to insert the new frames before the following exposure or overwrite it. If you select insert, any following exposure will be moved down. If you select Overwrite, the following exposure will be erased and replaced by the drawing being extended.

NOTE: You can also select the last cell where you want to extend your drawing to (such as the last cell of the layer), right-click and select **Extend Exposure**. You will not be prompted the dialog box.

How to extend an exposure gesturally

1. In the Xsheet view, select the red arrow  in the cell's right side. Make sure you see the drag down  cursor.

2. Pull down the selected cell to the desired frame.

NOTE: The red selection box must be visible when releasing the cursor. If not, the action is

considered cancelled.

How to extend an exposure from the top menu

1. Select a cell and do one of the following:
 - From the top menu, select **Animation > Cell > Extend Exposure**.
 - Press F5.

The Extend Exposure dialog box opens.

2. Enter the frame number you want to extend the cell to.

Extending Exposure Sequences

When working with a sequence that contains only numbers, you can extend an exposure sequence in a similar manner to extending a single exposure.

How to extend an exposure to create a sequence

1. In the Xsheet view, select a cell containing a number.
2. In the selected cell, click the red arrow  on the cell's right side. Make sure to see the drag down  cursor.

3. Hold down the Shift key. Make sure a plus sign (+) appears.
4. Pull down the selection box to the desired frame.

NOTE: The red selection box must be visible when releasing the cursor. If not, the action is considered cancelled.

5. First release the Shift key, then release the mouse button.

Extending Previous Drawing Exposures

T-HFND-006-005

When drawing on a blank frame, you can automatically create a new drawing and extend the timing from the previous exposed drawing.

In the following example, a cell is selected in the Timeline view for creating a new drawing in image A. In image B, the previous exposure does not extend to the new drawing, while in image C, it does.

A: A cell is selected for a new drawing.

B: The previous exposure is not extended to the beginning of the new drawing.

C: The previous exposure extends to the beginning of the new drawing.

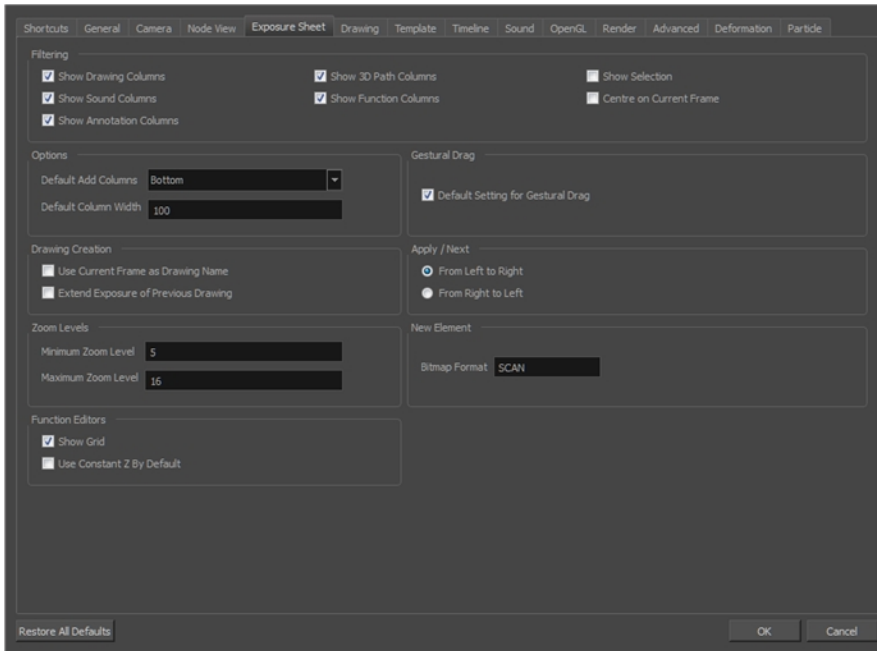

How to extend the exposure of previous drawings

1. Open the Preferences dialog box by doing one of the following:
 - Select **Edit > Preferences**.
 - Press **Ctrl + U** (Windows/Linux) or **⌘ + U** (Mac OS X).

The Preferences dialog box opens.

2. Select the **Exposure Sheet** tab.

3. In the Drawing Creation section, select the **Extend Exposure of Previous Drawing** option.

4. On the left side of the Timeline view, select a cell and create a new drawing.
The previous exposure automatically extends to the beginning of the new drawing.

Dragging Cells

To readjust your timing, you can drag one or more cells to a new location. You can drag a cell to any other frame in the same column or into another column.

You can turn off the Gestural Drag mode for the Xsheet view to prevent drawings from being dragged from one location to another. This feature does not apply to Annotation columns.

How to drag a cell to another location in the Timeline view

1. In the Timeline view, select one or more cells to move.

2. Drag the cells to the new location.

3. Drop the selection by doing one of the following:

- Drop by simply releasing the mouse or pen.

- Hold Ctrl (Windows/Linux) or ⌘ (Mac OS X) while dropping the selection to copy the cells. The original cells will not be moved.

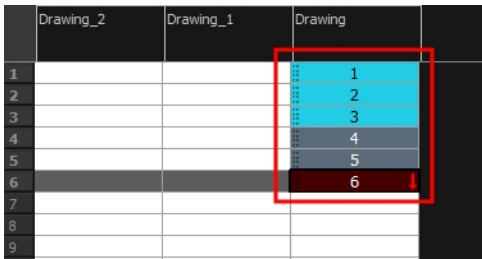

- Press Shift while dropping the selection to insert them between existing frames.

How to drag a cell to another location in the Xsheet view

1. In the Xsheet view, select one or more cells.

2. In the Xsheet view, position the pointer over the small dotted area  on the left side of the selected cells.

3. Drag the selection to any other cell in the same column or in another column.

4. Do one of the following:

- ▶ Drop the selection to overwrite the existing cells.

- Hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X) while dropping the selection to copy the cells. The original selection will not be moved.

- Press Shift while dropping the selection to insert it between existing frames.

	Drawing_2	Drawing_1	Drawing
1		1	
2		2	
3		3

15		9	
16		10	
17		11	
18		12	
19		13	

How to turn off the Gestural Drag mode

1. Do one of the following:
 - ▶ In the Xsheet view, right-click and deselect **Gestural Drag Mode**.
 - ▶ From the Xsheet menu, select **Edit > Gestural Drag Mode**
 - ▶ In the Xsheet toolbar, click the Toggle Gestural Drag Mode ↓ button (you may have to customize the toolbar to display it).

The dragging pad disappears on selected cells when the Gestural Drag mode is off.

Increasing Exposures

Increasing the exposure Adds one more exposure to a selected cell; repeating this action adds an extra cell each time. This is an efficient way to extend a drawing's exposure and is always set in Insert mode. Increasing an exposure pushes the existing exposure forward.

How to increase exposure

1. In the Timeline or Xsheet view, select a cell.

2. Do one of the following:

- From the top menu, select **Animation > Cell > Increase Exposure**.
 - In the Xsheet toolbar, click the Increase Exposure  button.
- ▶ At the bottom-right corner of the Xsheet view, set the number of cells over which the drawing will be exposed.

- Right-click and select **Exposure > Increase Exposure**.
- Press +.

Decreasing Exposures

Decreasing the exposure removes one exposure from a selected cell and pulls any cells following it to the beginning of selection. You can do this for one cell or a range.

How to decrease a single exposure

1. In the Timeline or Xsheet view, select a cell.

	Drawing_2	Drawing_1	Drawing
1			1
2			
3			
4			
5			
6			
7			
8			
9			2
10			3
11			4
12			5
13			6

2. Do one of the following:
 - From the top menu, select **Animation > Cell > Decrease Exposure**.
 - In the Xsheet toolbar, click the Decrease Exposure  button.

- ▶ At the bottom-right corner of the Xsheet view, set the number of cells over which the drawing will be exposed.

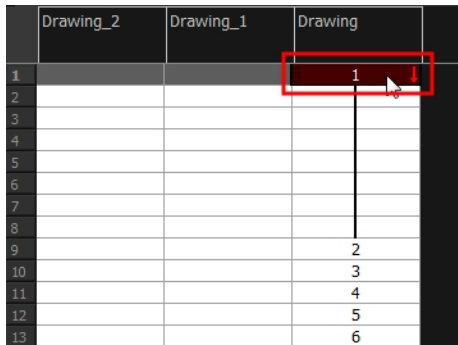

- Right-click and select **Exposure > Decrease Exposure**.
- Press -.

How to decrease a range of exposures

1. In the Timeline or Xsheet view, select a range of cells.

	Drawing_2	Drawing_1	Drawing
1			1
2			
3			
4			
5			
6			
7			
8			
9			2
10			3
11			4
12			5
13			6

2. Do one of the following:

- From the top menu, select **Animation > Cell > Clear Exposure and Pull**.
- Right-click and select **Exposure > Clear Exposure and Pull**.
- In the Xsheet toolbar, click the Clear Exposure and Pull  button.

The exposure is reduced by the selected number of cells.

Deleting Exposures

You can delete a drawing's exposure in several ways. When you delete a drawing's exposure from the Timeline or Xsheet view, you are not deleting the actual drawing file. You can always retrieve it by typing its name again in a cell.

You can delete the exposure in a selected cell range or delete the entire exposure of a drawing exposed over several cells. Note that you can also delete the exposure for drawings inside a collapsed group.

How to delete selected exposures

1. In the Timeline or Xsheet view, select the exposure you want to delete.
2. Do one of the following:
 - Right-click and select **Delete**.
 - Press Delete.

How to clear the entire exposure of a drawing

1. In the Timeline or Xsheet view, select a cell of a drawing exposed over several cells.
2. Do one of the following:
 - From the top menu, select **Animation > Cell > Clear Exposure**.
 - In the Timeline view, right-click and select **Exposure > Clear Exposure**.
 - In the Xsheet toolbar, click the Clear Exposure  button (you may have to customize the toolbar to display it).

Inserting Blank Cells

You can place an empty cell between other cells. If you are set to Overwrite mode, the mode momentarily changes to Insert mode, in order to push down the existing exposures,

How to insert a blank cell

1. In the Timeline or Xsheet view, select the cell in which you want to insert a blank cell.

Drawing

Setting the Exposure

T-HFND-006-009

You can easily increase or decrease the exposure for a selected cell range.

How to set the exposure

1. In the Timeline or Xsheet view, select the cell range on which you want to set the exposure.

2. Do one of the following:
 - Select **Animation > Cell > Set Exposure to > Set Exposure to 1, 2, 3, or Set Exposure**.
 - In the Timeline toolbar, click one of the Set Exposure     buttons (you may have to customize the toolbar to display them).
 - In the Xsheet view, right-click and select **Exposure > Set Exposure to > Set Exposure to 1, 2, or 3, or Set Exposure**.
3. If you chose the Set Exposure option, the Set Exposure dialog box opens. Enter the number of frames you want the drawings to display and click **OK**.

The new timing is displayed in the Xsheet view.

Filling Selections with Single Exposures

You can Lets you fill the same value over an entire selection. The selection can be over one cell, a cell range in one column, a cell range over many columns, an entire column, or many columns. You can use numbers, words, letters, or any alphanumeric value.

How to fill a selection with a single exposure

1. In the Timeline or Xsheet view, select a cell range.

2. Do one of the following:
 - ▶ From the top menu, select **Animation > Cell > Fill Selection**.
 - ▶ In the Xsheet toolbar, click the Fill Selection  button (you may have to customize the toolbar to display it).
 - ▶ Press **Ctrl + T** (Windows/Linux) or **⌘ + T** (Mac OS X).

The Fill Selection dialog box opens.

3. In the Value field, type the desired value.
4. To insert a key exposure in the frame following the last cell in the selection, select the **Add Key Exposure After** option. Otherwise, leave it deselected.
5. Click **OK**.

Filling Selections with Sequences

You can let us create a numbered sequence over a selection. The sequence can be forward, backward, single, double or higher increment, as a cycle, and so on. The selection can be over one cell or a cell range in one column or more or an entire column or many entire columns.

How to fill a selection with a sequence

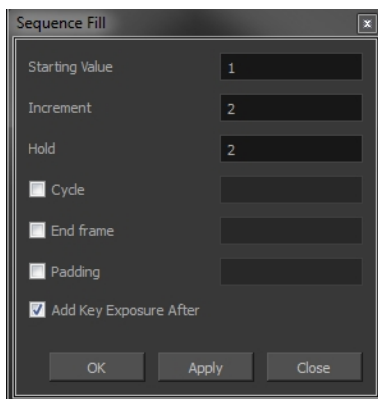

1. In the Timeline or Xsheet view, select a cell range.

2. Do one of the following:

- From the top menu, select **Animation > Cell > Sequence Fill**.
- In the Timeline view, right-click and select **Exposure > Sequence Fill**.
- In the Xsheet toolbar, click the Sequence Fill  button (you may have to customize the toolbar to display it).
- Press **Ctrl + M** (Windows/Linux) or **⌘ + M** (Mac OS X).

The Sequence Fill dialog box opens.

3. In the Starting Value field, type the first number in the sequence.

4. In the Increment field, type the number by which the drawing number will increase from frame to frame. For example, an increment of 1 gives you: 1-2-3-4; an increment of 2 gives you: 1-3-5-7; and -2 gives you this: 8-6-4-2.

Filling Selections Randomly

You can let us fill in random values over a selection. You can give a maximum and a minimum value and create a range for Harmony to choose the random values from. The selection can be over one cell or a cell range in one column or more or an entire column or many entire columns.

How to fill cells randomly

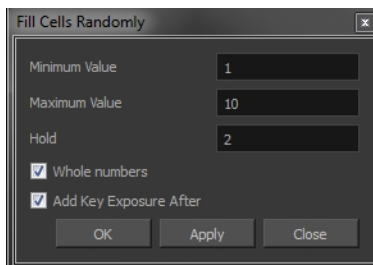

1. In the Timeline or Xsheet view, select a cell range.

2. Do one of the following:

- Select **Animation > Cell > Fill Cells Randomly**.
- In the Xsheet view, click the Fill Cells Randomly  button (you may have to customize the toolbar to display it).

The Fill Cells Randomly dialog box opens.

3. In the Minimum Value field, enter the lowest acceptable value.
4. In the Maximum Value field, enter the highest acceptable value.
5. In the Hold field, choose an exposure holding value.
6. If you are applying this option to a drawing column, select the **Whole Numbers** option to avoid decimal points.

7. Click **OK**.

Filling Empty Cells

You can let us fill empty cells to extend the exposure of single frame drawings to fill the range of empty cells after each one. When creating drawings on cells that are not side-by-side, the exposure of the first drawing no longer fills automatically. You must select the frame range where you want your drawings to hold their exposure up to the next drawing and use the Fill Empty Cells command.

How to fill empty cells

1. In the Timeline or Xsheet view, select a cell range.

2. Do one of the following:

- Right-click and select **Exposure > Fill Empty Cells**.
- From the top menu, select **Animation > Cell > Fill Empty Cells**.
- In the Timeline toolbar, click the Fill Empty Cells  button.

Each drawing in the selection is exposed in the range of empty cells that follow it.

About Cycles

T-HFND-006-008

Once you have entered a series of drawings and exposures, you can create cycles out of them in several ways.

You can loop drawings using the following commands:

- Create Cycle
- Paste Cycle
- Paste Reverse

When you create a drawing cycle, all the repeated drawings are linked to the same original files. When modify, repaint, or correct a drawing named “1” for example, all drawings named “1” are updated simultaneously. In order to modify a drawing independently from its other exposures, you must duplicate the drawing.

Creating Cycles

You can create cycles for animated sequences that need repeating, such as a character walking.

How to create a cycle

1. In the Timeline or Xsheet view, select the cell range to loop.

2. In the Timeline toolbar, click the Create Cycle  button (you may have to customize the toolbar to display it).

The Create Cycle dialog box opens.

3. Enter the number of cycles you want, including the current selection.

Pasting Cycles

Once you have created a cycle from an animated sequence, you can paste it anywhere, for as many times as you like and in any direction that you choose.

How to paste a cycle

1. In the Timeline or Xsheet view, select the cell range to loop.

2. From the top menu, select **Edit > Copy Cell from Timeline or Xsheet** or press **Ctrl + C** (Windows/Linux) or **⌘ + C** (Mac OS X).
3. In the Timeline or Xsheet view, select the cell where you want your cycles to start.

4. Do one of the following:
 - From the top menu, select **Edit > Paste Cycle**.
 - Right-click and select **Paste Cycle**.
 - Press **Ctrl + /** (Windows/Linux) or **⌘ + /** (Mac OS X).

The Paste Cycle dialog box opens.

5. Do one of the following:

- In the Number of Cycles field, enter the number of cycles you want to paste.
- Increase or decrease the number of cycles you want to paste.

6. In the Cycle Type menu, select the type of cycle you want to paste.

- **Normal (forward)**: Pastes cycles as for all cycles, starting with the first cell of your selection and ending with the last.
- **Reverse**: Pastes cycles in the reverse order of the original selection, starting with the last cell of your selection and ending with the first one.
- **Forward > Reverse**: Pastes the first cycle in your selection as is, then the following one in reverse order. This repeated until all cycles are pasted.
- **Reverse > Forward**: Pastes the first cycle in your selection in reverse order, then the following one as is. This repeated until all cycles are pasted.

7. Click **OK**.

Pasting Reversed Cycles

Once you've copied an animated sequence, you can paste back its drawings in the reverse order.

NOTE: You can perform the same operation using the Paste Special dialog box. To open the Paste Special dialog box, select **Edit > Paste Special** or press Ctrl + B (Windows/Linux) or ⌘ + B (Mac OS X).

How to paste a reversed cycle

1. In the Timeline or Xsheet view, select the cell range to paste in reverse order.

2. From the top menu, select **Edit > Copy Cell from Timeline or Xsheet** or press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).
3. In the Timeline or Xsheet view, select the cell where you want your cycles to start.

4. Do one of the following:
 - From the top menu, select **Edit > Paste Reverse**.
 - Right-click and select **Paste Reverse**.
 - Press Ctrl + . (Windows/Linux) or ⌘ + . (Mac OS X).

Overwriting Exposures and Keyframes

If the area on which you are dropping a selection contains exposures and/or keyframes, they are overwritten by the content you selected by dragging. You can set this mode in two places: the Timeline toolbar and the Preferences dialog box.

How to overwrite exposures and keyframes

1. In the Timeline or Xsheet view, drag to select the drawings you want to move.
2. Do one of the following:
 - In the Timeline toolbar, click the Toggle Override Exposure and Keyframe During Drag and Drop  button (you may have to customize the toolbar to display it).
 - From the top menu, select **Edit > Preferences** or press Ctrl + U (Windows/Linux) or ⌘ + U (Mac OS X). Select the **Timeline** tab, then select the **Override Exposures and Keyframes During Drag and Drop** option.

3. Drop your selection at the desired location.

About Key Exposures

Before working with key exposures, it's important to understand how keyframes, exposure and key exposure work in Harmony:

- **Keyframe:** A keyframe is a point in time where a change to the properties of the object or character occurs. In Harmony, keyframes consist of the coordinates that determine how an entire layer and its contents are moved. Keyframes include these parameters: XYZ position, skew, scale, angle and pivot.
- **Exposure:** Exposure is a property; it is the length of time that a drawing is visible over a series of frames. In Harmony, exposure is independent of keyframes. That is, keyframes are not linked to drawings. Keyframes can be moved independently from the drawing exposure.
- **Key Exposure:** A key exposure in Harmony is a type of exposure that forces a drawing to remain exposed on a specific frame. If a drawing is exposed before a key exposure and you swap out that drawing for another one, then the original drawing is retained. This preserves the key drawing. Note that Harmony automatically sets a key exposure when you perform a drawing swap.

Adding Key Exposures

Key exposures are mainly used for swapping drawings in cut-out animation where you will have numerous drawings for the various positions of the mouth or eyes of a character for example.

If there is a particular drawing you want to keep on a specific frame, you can set it as a key exposure. This prevents it from being overwritten by a drawing swap on a preceding frame. A key exposure is simply a property of an exposure that forces it to be exposed on a certain frame regardless of whether the previous exposure is the same drawing or not.

NOTE: Keep in mind that if you modify the artwork in a drawing, all instances of that drawing will be automatically updated even if set as a key exposure. This keeps your existing animation key poses intact. It is frequently used on a mouth or eyes layer.

Example: Swapping a drawing with no key exposure

In the following example, drawing 3 (DR 3) is selected on the timeline and it contains no key exposure.

When it is swapped for drawing 4 (DR 4), the entire duration of drawing 3 substituted for drawing 4.

Example: Swapping a drawing with a key exposure

Here's what happens when swapping a drawing with a key exposure. In the following example, the playhead is positioned in the middle of drawing 5 (DR 5) to set the position for the new key exposure. When the new key exposure is added, drawing 5 is split in two; both halves contain drawing 5. Now if you swap the first drawing 5 for drawing 1, the second drawing 5 retains its exposure.

A location is selected for a new key exposure.

A key exposure is added at the location of the playhead.

One drawing is swapped for drawing 1 (DR 1). The second drawing retains its exposure.

How to add a key exposure

1. In the Timeline view, select the drawing cell to set as the key exposure.
2. Do one of the following:
 - In the Timeline toolbar, click the Add Key Exposure  button.
 - In the Timeline menu, select **Exposure > Add Key Exposure**.
 - Right-click and select **Exposure > Add Key Exposure**.

A new key exposure is added.

If you added a key exposure at the beginning of the drawing, the entire exposure is filled with that same drawing. If you added a key exposure anywhere other than the beginning of the drawing, then the drawing is split in two and both parts contain the same drawing.

Removing Key Exposures

When you no longer need a key exposure, you can remove it. When you do this, the existing key exposure is replaced by the preceding exposure. In the following example, a key exposure is set to drawing 1 (DR 1). When the key exposure is removed, the exposure is replaced by the preceding exposure, drawing 4 (DR 4).

Before: Key exposure is set to drawing 1.

After: Key exposure is removed. The preceding exposure, drawing 4, replaces the exposure.

How to remove a key exposure

1. In the Timeline view, select a key exposure to remove.
2. Do one of the following:
 - In the Timeline toolbar, click the Remove Key Exposure  button.
 - In the Timeline menu, select **Exposure > Remove Key Exposure**.
 - Right-click and select **Exposure > Remove Key Exposure**.

The key exposure is removed and replaced by the preceding exposure.

Removing Duplicate Key Exposures

When working with drawings to adjust the timing of a mouth in a lipsync, for example, and forcing the use of specific key exposures, unnecessary key exposures will be created. You can delete these duplicates without affecting the rest of the drawing. The first drawing of the selection will be used for the range.

NOTE: Duplicate key exposures may occur when pasting with the Enforce Key Exposure option selected.

How to remove duplicate key exposures

1. In the Timeline view, select the layer that contains duplicate key exposures.
2. In the Timeline toolbar, click the Remove Duplicate Key Exposure  button (you may have to customize the toolbar to display it).

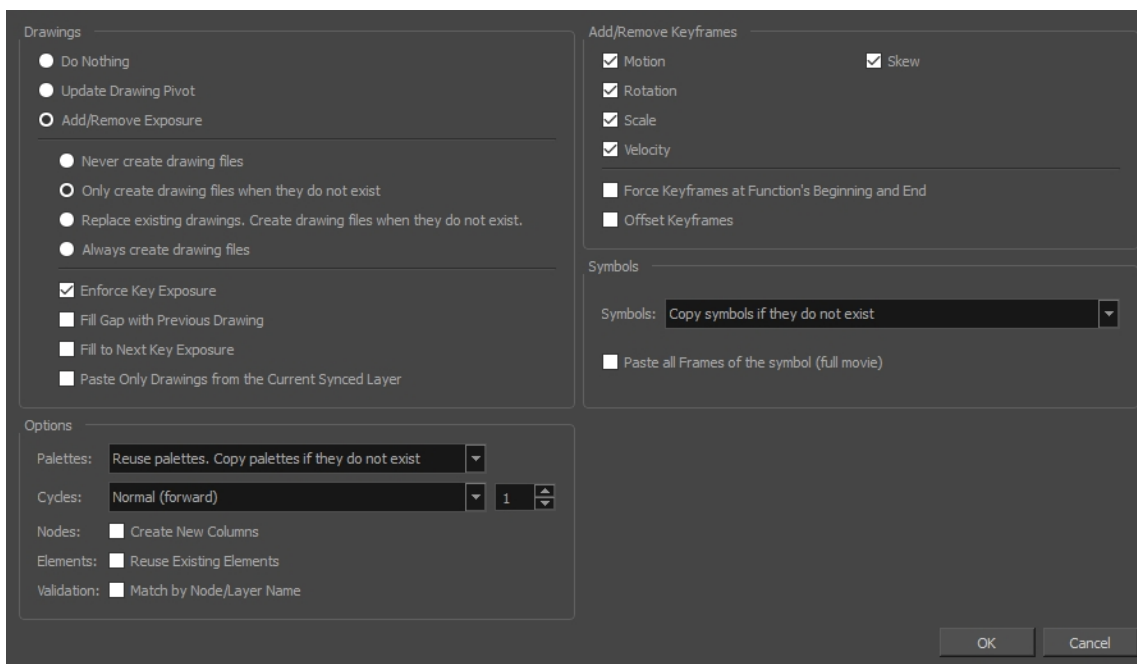

Pasting Key Exposures Using Different Modes

As you animate, you will find that you reuse key exposures. There are different options to paste your selected drawings when they contain key exposures:

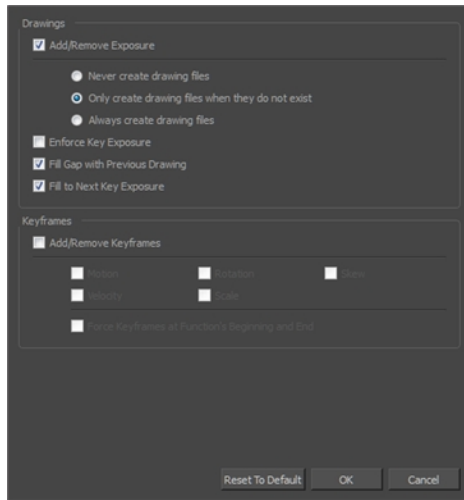

- **Enforce Key Exposure:** If there are key exposures that exist on copied drawings, they are preserved when pasting. No key exposures are added. This is the default behavior when pasting.
- **Fill Gap with Previous Drawing:** Fills selected area in the Xsheet or Timeline view with the previous drawing.
- **Fill to Next Key Exposure:** Fills selected area till the next key exposure.

How to paste using different modes

1. In the Timeline or Xsheet view, select the drawings you want to copy and press **Ctrl + C** (Windows/Linux) or **⌘ + C** (Mac OS X).
2. In the Timeline or Xsheet view, select the cell where you want your pasted selection to start.
3. Do one of the following:
 - ▶ Press **Ctrl + B** (Windows/Linux) or **⌘ + B** (Mac OS X).
The Paste Special dialog box opens.

- ▶ From the Timeline menu, select **Edit > Modify Paste Presets > Exposure**.
The Edit Exposure Paste Preset dialog box opens.

4. Select the **Enforce Key Exposure** or **Fill to Next Key Exposure** option. In the Paste Special dialog box, these options are on the Basic tab.
5. Click **OK**.
6. Press **Ctrl + V** (Windows/Linux) or **⌘ + V** (Mac OS X) to paste your selection.

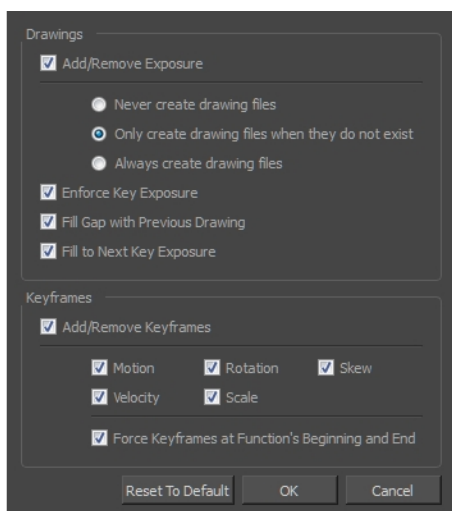

Modifying Paste Presets

When pasting key frames and exposures, you can modify the existing presets to your liking. There are three presets you can modify: the default presets for both key frames and exposures, key frames only and exposures only.

How to modify paste presets

- From the Timeline view menu, select **Edit > Modify Paste Presets** and one of the following options:
 - All** to edit the default paste preset settings.
 - Key Frame** to edit the preset settings for pasting key frames.
 - Exposure** to edit the preset settings for pasting exposures.

The Edit Paste Presets dialog box opens.

- Refer to the following table and edit the presets as desired.

Parameter	Description
Drawings	
Add/Remove Exposure	Never create drawing files: When adding exposures to a drawing layer, drawing files will not be created.
	Only create drawing files when they do not exist: When adding exposures to a drawing layer, new drawings will be created only when drawings with the same name do not already exist in the destination.
	Always create drawing files: When adding exposures to a drawing layer, new drawings will always be created. If drawing files with the same name already exist, Harmony will create a new name for the drawing.
Enforce Key Exposure	If there are key exposures that exist on copied drawings, they are preserved when pasting. No key exposures are added. This is the default behavior when pasting.
Fill Gap with Previous Drawing	Fills selected area in the Xsheet or Timeline view with the previous drawing.

Fill to Next Key Exposure	Fills selected area till the next key exposure.
Keyframes	
Add/Remove Keyframes	Motion: Copies the properties of the selected motion keyframe to the new frame.
	Velocity: Copies the properties of the selected velocity keyframe to the new frame.
	Rotation: Copies the properties of the selected rotation keyframe to the new frame.
	Scale: Copies the properties of the selected scale keyframe to the new frame.
	Skew: Copies the properties of the selected skew keyframe to the new frame.
	Force Keyframes at Function's Beginning and End: Adds a keyframe to the beginning and end of the pasted function, reproducing the source function.

About Drawings

Drawings that are created in Toon Boom Harmony are not stored in their cells. They are actual files stored in the project's folder. If you want to rename a drawing or delete a drawing from your project, you need to edit the file and not the cells.

Renaming Drawings

T-HFND-005-003

To rename a drawing, you need to select the drawing cell and use the Rename Drawing command.

You can also rename a series of drawings relative to their frame position, which is useful in hand-drawn animation.

How to rename a drawing

1. In the Timeline or Xsheet view, select the drawing to rename.

2. Do one of the following:
 - Right-click and select **Drawings > Rename Drawing**.
 - In the Timeline toolbar, click the Rename Drawing  button (you may have to customize the toolbar to display it).
 - Press Ctrl + D (Windows/Linux) or ⌘ + D (Mac OS X).

The Rename Drawing dialog box opens.

3. In the New Name field, type in the new drawing name.

How to rename a drawing sequence with a prefix

You can rename a drawing sequence with a prefix, which can be quite useful for cut-out puppet breakdown and deformation animation.

1. In the Timeline or Xsheet view, select a drawing sequence. Note that you can only select a drawing range in one column or layer at a time.
2. Right-click and select **Drawings > Rename Drawing with Prefix**.

The Rename Drawing with Prefix dialog box opens.

3. In the Prefix to Add field, type the prefix to add before the drawing name.

How to rename drawings by their frame position

1. In the Timeline or Xsheet view, select the drawing sequence to rename.

2. Select **Drawing > Rename by Frame**.

Deleting Drawings

You can permanently delete a drawing file from a project's folder.

NOTE: Deleting a drawing file is an operation that cannot be undone.

How to delete a drawing

1. In the Timeline or Xsheet view, select the drawings to delete.

2. Do one of the following:
 - ▶ From the top menu, select **Drawing > Delete Selected Drawings**.
 - ▶ Right-click and select **Drawings > Delete Selected Drawings**.

Duplicating a Drawing

If you want to modify a drawing that already exists, but keep the original drawing intact, you can duplicate the drawing and work on the copy. When duplicating a drawing, the selected cell is replaced with the new drawing. The exposure of the original drawing that was on the current cell is removed. The original drawing is not deleted from the project folder or other cells in which it is exposed.

With Toon Boom Harmony, you can create a keyframe at the same time as you duplicate your drawing. This way, you can modify and reposition drawings without affecting the original drawing.

How to duplicate a drawing

1. In the Timeline or Xsheet view, select the drawing to duplicate.

2. Do one of the following:
 - ▶ From the top menu, select **Drawing > Duplicate Drawings**.
 - ▶ Right-click and select **Drawings > Duplicate Drawings**.
 - ▶ In the Xsheet toolbar, click the Duplicate Drawing  button.
 - ▶ Press **Alt + Shift + D**.

Copying and Pasting Drawings

When you copy and paste a selection in the Timeline or Xsheet view, you are not copying and pasting the actual drawings, you are pasting the exposure. Exposure is a property; it is the length of time that a drawing is visible over a series of frames. In Harmony, exposure is independent of keyframes. That is, keyframes are not linked to drawings. Keyframes can be moved independently from the drawing exposure.

If you want to copy and paste selected drawings into a different layer or paste the selection in the same layer to duplicate the drawings, you must use the Paste Special feature.

There are four different ways to paste your selected drawings with the Paste Special dialog box:

When adding exposures to a drawing layer, drawing files will not be created.

Only create drawing files when they do not exist: When adding exposures to a drawing layer, new drawings will be created only when drawings with the same name do not already exist in the destination.

Replace existing drawings. Create drawing files when they do not exist: Replace drawings with the same names to update a scene with new modified drawings and preserve the animation.

Tip: If you don't want to lose the existing animation when pasting a template, such as when placing new drawings after the animation, then delete the template's animation. It will still have updated the drawings but not override the existing animation.

Always create drawing files: When adding exposures to a drawing layer, new drawings will always be created. If drawing files with the same name already exist, Harmony will create a new name for the drawing.

If you want to perform another Paste Special operation using the same settings you used previously, you can use the Paste Special Again command instead. You can paste your selection using the same settings as in the most recent Paste Special operation, without opening the Paste Special dialog box.

How to paste drawings with the Paste Special command

1. In the Timeline or Xsheet view, select the drawings to copy and press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).

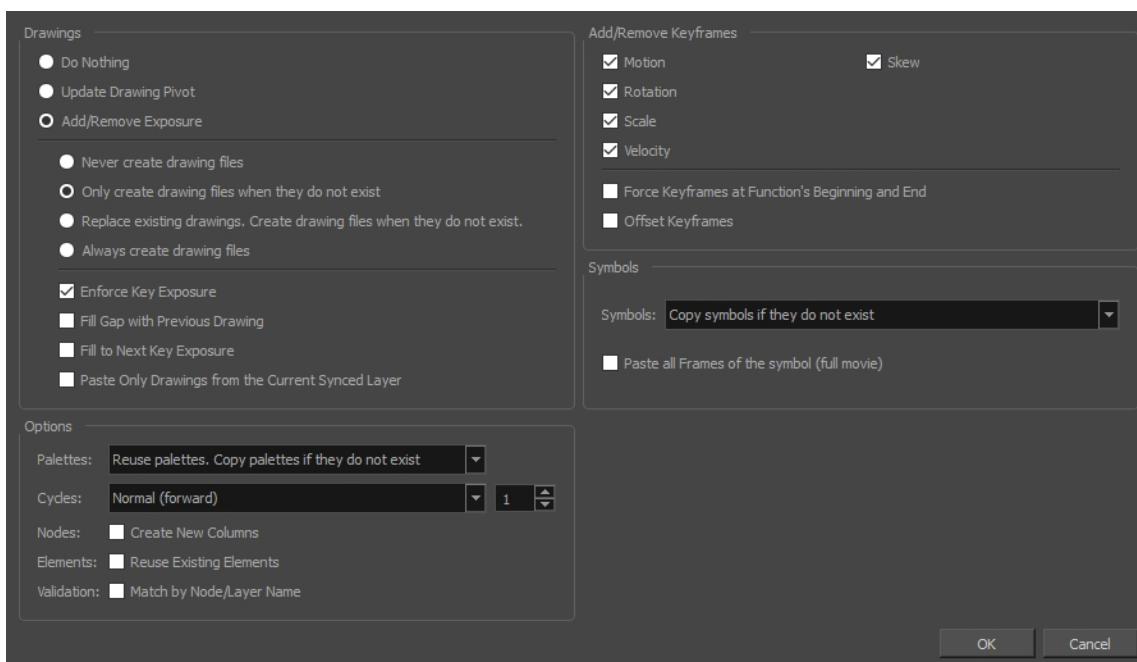

2. In the Timeline or Xsheet view, select the cell where you want your pasted selection to start.

3. Do one of the following:

- Right-click and select **Paste Special**.
- From the top menu, select **Edit > Paste Special**.
- In the Xsheet or Timeline toolbar, click the Paste Special  button (you may need to customize the toolbar to display it).
- Press Ctrl + B (Windows/Linux) or ⌘ + B (Mac OS X).

The Paste Special dialog box opens.

4. Select the **Basic** tab.

5. In the Drawings section, select the **Always Create Drawings** or **Only Create Drawings When They Do Not Exist** option.

How to paste new drawings with the previous Paste Special settings

1. Do one of the following:

- From the top menu, select **Edit > Paste Special Again**.
- Right-click and select **Paste Special Again**
- In the Timeline or Xsheet toolbar, click the Paste Special Again  button (you may have to customize the toolbar to display it).
- Press Ctrl + Shift + B (Windows/Linux) or  + Shift + B (Mac OS X).

Merging Drawings

There are two methods of merging drawings.

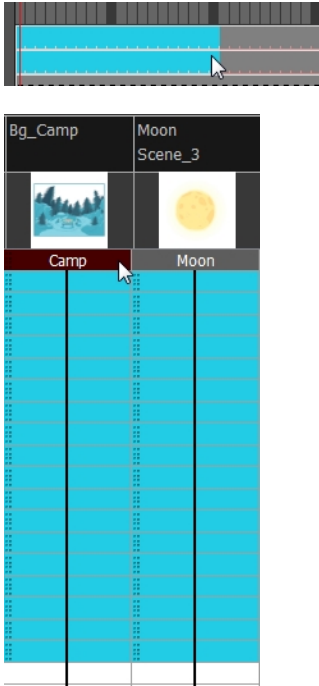

- You can merge selected drawings in adjacent elements. The columns and layers will be left intact, and each new merged drawing will reside in the frames of the left-most column or lower layer.
- You can merge elements. All drawings will be merged. Unused columns and layers will be deleted, but the original drawing files are still accessible.

Merging Selected Drawings

You can merge drawings from adjacent layers or columns. The merged drawings will appear in the lower layer or left-most column of the two layers or columns selected.

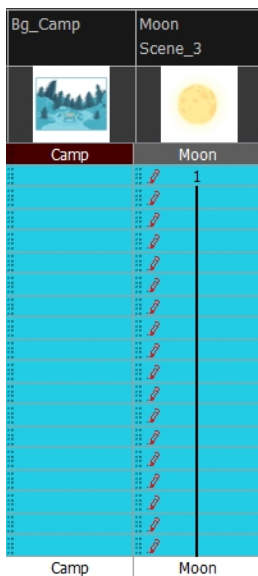

How to merge selected drawings

1. In the Xsheet view, select the drawings to merge.

2. Do one of the following:
 - ▶ In the Xsheet menu, select **Columns> Merge Selected Drawings**.
 - ▶ In the Timeline menu, select **Layers > Merge Selected Drawings**.

3. Do one of the following:

- ▶ In the Xsheet menu, select **Columns > Merge Selected Columns**.
- ▶ In the Timeline menu, select **Layers > Merge Selected Layers**.

In the Xsheet view, the right-most column will contain the merged drawings and the remaining columns will be left blank at the corresponding frames. In the Timeline view, the bottom timeline layer will contain the merged drawings from all layers and the other layers will be left blank at the corresponding frames. Drawings are not deleted and are still accessible.

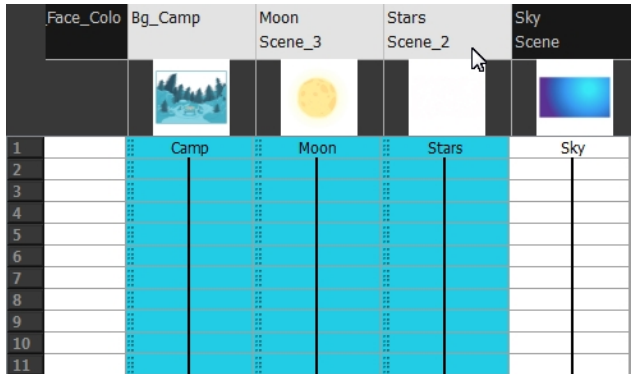

Merging All Drawings

You can merge all the drawings in two layers or columns.

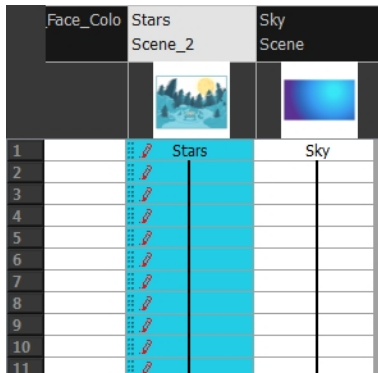

How to merge all the drawings in two layers or columns

1. Do one of the following:

- ▶ In the Timeline view, select the layers you want to merge.
- ▶ In the Xsheet view, Shift-click the headers of the columns you want to merge.

- ▶ In the top menu, select **Edit > Merge**.
- ▶ In the Xsheet menu, select **Columns > Merge Selected Columns**.
- ▶ In the Timeline menu, select **Layers > Merge Selected Layers**.

In the Xsheet view, the right-most column will contain the merged drawings and the other columns will be deleted. In the Timeline view, the bottom timeline layer will contain the merged drawings from all layers and the other layers will be deleted. Drawings are not deleted and are still accessible.

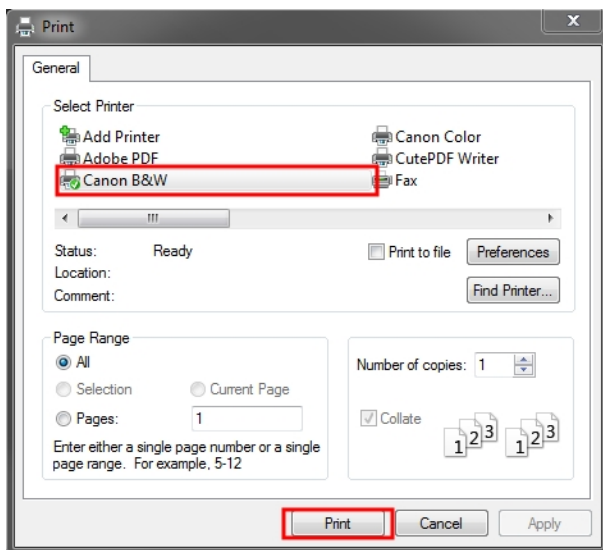

Printing the Xsheet

Once you have marked all the information, corrections, and timing you want in the Xsheet view, you can print your exposure sheet. Printing the Xsheet allows you to take it with you to your animation table or give a copy to the animator. You can also use it to create your Xsheet skeleton directly in Harmony.

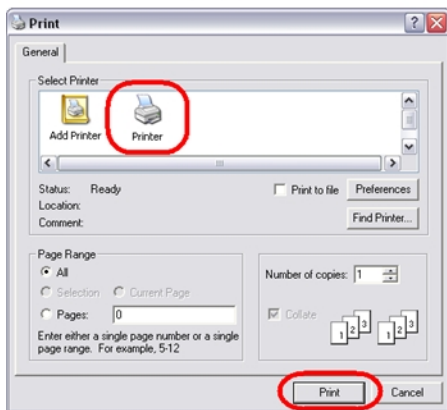

How to print your exposure sheet

1. Select **File > Print > Xsheet**.

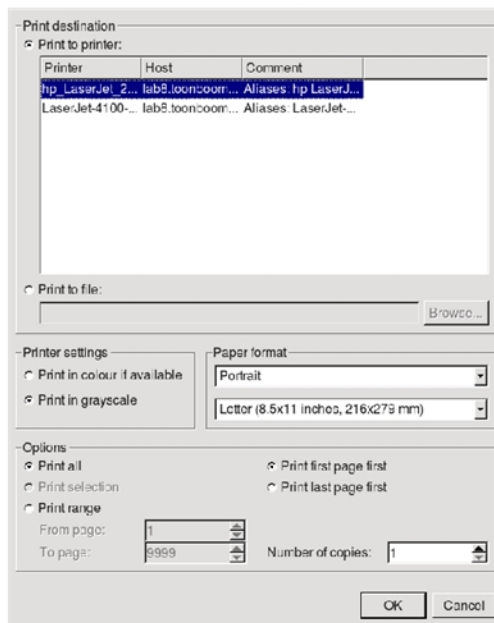

The Print dialog box opens.

Windows

Linux

Mac OS X

2. To set up your print:

- **Windows:** In the Select Printer section, select your printer and adjust the rest of the printing settings.
- **Linux:** In the Print Destination section, select your printer and adjust the rest of the printing settings.
- **Mac OS X:** In the Printer section, select your printer and adjust the rest of the settings by clicking on the Parameters  button. You can also click **PDF** and select an option from the menu if you want to save a PDF version of your exposure sheet.

NOTE: Refer to your printer user guide to learn more about its options.

3. Do one of the following:

- **Windows and Mac OS X:** Click **Print**.
- **Linux:** Click **OK**.

	A	B	C	D	Annotation

Chapter 7: Colours

Toon Boom Harmony has some very powerful painting features to add colour to your drawings. Whereas some other software only allow users to work with on colour swatch at a time, painting in Harmony is done by using palettes containing multiple colour swatches that can be saved and reused as needed.

In the Colour view, you choose a different colour swatch for each colour you want to paint in your drawing. You can add as many swatches as you want. You can also rename them and modify existing ones.

When you modify the colour of an existing swatch, it automatically updates all the zones painted with this swatch throughout the entire project. The colour swatch has a unique ID number that associates it with the painted zones. This way, you can change the look of your character at any time without having to repaint it!

Another advantage of this system is that you can create complete palettes for different lighting situations. For instance, in addition to the regular palette for a character, you could have one for that character in the rain using colours that are duller and less vibrant than the dry daytime colours, or yet another for using in a night scene. Using palettes linked to your character in this way allows you to instantly change its colouring to suit the mood and atmosphere of the scene without tediously repainting each element.

Di-Gata Defenders © Nelvana Limited, Corus® Entertainment Inc.

It is also possible to use colour swatches from palettes in bitmap drawings, although changing the colours in the palettes will not automatically update colours used in bitmap layers. Likewise, it is possible to create drawing layers with bitmap line art and vector colour art, all with the same palettes –see [About Art Layers on page 325](#) and [Creating Colour Art from Line Art on page 331](#).

About Colour Swatches

T-HFND-006-017

You can use several different types of colour swatches, including solid colour, gradient colour and bitmap texture swatches.

A colour palette is an actual file on the hard drive.

In Harmony Server, these palette files can be stored in a different location on the server. They can be stored in the Environment, Job, Scene, or Element folder and linked to any palette list. This means that if the original palette file is modified, it will update in every drawing element the palette is linked to.

In Harmony Server, to avoid accidentally modifying the palette, the palette files can be locked. If a palette must be modified, you must get the rights to modify them before doing so.

In Toon Boom Harmony, when you add a swatch, it is created using the colour of the currently selected swatch from your palette. However, you can set a default colour to be used every time you create a new colour in your colour palette. This is useful for creating different shades of the same basic colour.

The default colour is also the colour used when you choose to vectorize images you're scanning into your scene, however you add the Default colour swatch to your palette in a different way, so it's unique. It has a unique ID number that makes it easily recognizable from all the other colours in your colour palettes. Being able to change this colour allows you to change the basic colour of all scanned drawings. This can be useful on more than just an aesthetic level as sometimes when you go to NTSC or PAL, pure colours, such as pure black, can create problems.

Locking and Unlocking the Colour List

In Harmony Server, you can lock and unlock the colour list to avoid modifying or modify the colour swatches.

How to lock and unlock the colour list

1. In the Colour view, click the Edit Palette Mode  button.

A grey pencil icon appears in the top-right corner of the Palette list.

Adding a Colour Swatch

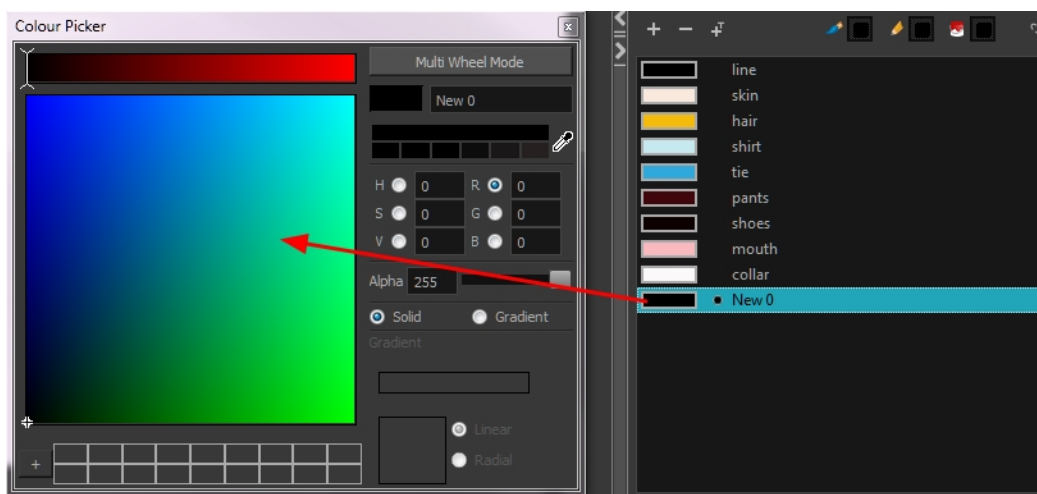

T-HFND-006-017A

You can add as many colour swatches as you want in your palette.

How to add a solid colour swatch

1. In the Colour view, click the Add Colour **+** button.
2. From the Colour view menu, select **Colours > Edit** or double-click on the colour swatch.

The Colour Picker window opens.

3. To set your colour, do one of the following:
 - In the colour wheel, select a colour.
 - Enter the HSV or RGB values in the corresponding fields.
 - Select the **R,G,B,H,S** or **V** options to change the look of the colour picking area.

- Click the Dropper  button to select any colour on your screen. It can be from the Harmony interface, your operating system or any other open application.

You can also click **Multi Wheel Mode** to open the Multiwheel Colour window. This displays all the picking area styles together and also contains a picking undo list. To return to the regular Colour Picker window, click **Single Wheel Mode**.

4. Click on the Shade Scale swatches to modify the shade of the selected colour.

5. Adjust the transparency with the Alpha slider or type the value directly in the Alpha field.

- Click the **Add** button to add the current selected colour to the Colour Storage Library, so you can quickly access it later.

- Rename the colour swatch in the Colour Picker window or directly in the colour list by double-clicking on its name.

How to change the default swatch colour for all your colour palettes

- Select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
- In the Preferences dialog box, select the **Drawing** tab.
- In the New Colour Pots section, select the **Create New Colour Pots Using the Default Colour** option. You can also click the colour swatch beside the option to change the default colour.

How to add a new colour swatch using the default colour

- From the Colour view menu, select **Colours > New**.

A new swatch is added to your palette using the default colour swatch colour. The new swatch created with the New command will be named **New 0**.

Deleting a Colour Swatch

T-ANIMPA-003-007

You can delete unnecessary colour swatches from your palette. If painted zones are using this colour, they will be displayed in red and the system will try to recover them the next time you load the scene.

How to delete a colour swatch

1. In the Colour view, select the colour swatches to delete.

2. Do one of the following:
 - From the Colour View menu, select **Colours > Delete**.
 - Click the Delete Colour  button.
 - Right-click and select **Delete**.
 - Press Delete.

If the colour swatch is used in a drawing, the Delete Colour dialog box opens.

3. Click **OK** to delete the colours or click **Cancel** to abort the operation.

If you delete colour swatches already in use, the zones painted with them turn red so you can easily identify them.

Adding a Gradient Colour Swatch

T-HFND-006-017B

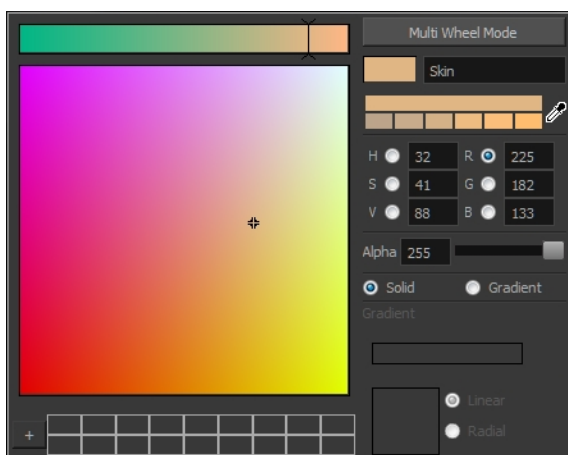

You can transform any colour swatch into a linear or radial gradient.

How to create a gradient colour swatch

1. In the Colour view, select a colour to modify .
2. Do one of the following:
 - Click the new colour and from the Colour View menu, select **Colours > New**.
 - Double-click on the colour swatch.

The Colour Picker window opens.

3. Select the **Gradient** option.
4. Select the **Linear** or **Radial** option.
5. Adjust the Gradient arrows to modify the colours.

- Add extra colours by clicking between the arrows below the gradient bar. Then click on the

Colour Preview to select a colour.

- Pull down the arrows to remove them.

- Move the arrows left and right to modify the gradient distance.

NOTE: To learn how to reposition the gradient zones in your drawings, see [About the Edit Gradient and Texture Tool](#) on page 551.

Adding a Texture Colour Swatch

T-HFND-006-017C

You can add bitmap texture colour swatches to your palette.

How to create a texture colour

1. From the Colour menu, select **Colours > New Texture** or click the New Texture  button.
The Browser window opens.
2. Browse for a PSD or TGA bitmap file created with a third party software and click **Open**.

The texture is added to the colour list.

NOTE:

To learn how to reposition the textured zones in your drawings, see [About the Edit Gradient and Texture Tool on page 551](#).

You can also replace a texture once it is painted. If you decide to make the character's shirt wool instead of plaid, just update the texture file in the swatch and the entire project updates. Any transformation previously applied to the texture's position in your drawings will be kept.

Modifying a Texture Colour Swatch

You can replace a texture colour swatch and all zones already painted with it will update.

How to replace a texture swatch

1. In the Colour view, select the texture swatch that contains the bitmap texture you want to replace.

2. From the Colour View menu, select **Colours > Edit Texture** or double-click on the swatch.

The Browser window opens.

3. Browse for the new PSD or TGA bitmap file created in a third party software.

4. Click **Open** to update the colour swatch.

Mixing Colours

If you want to modify a series of colours to blend a tint in them or offset their RGBA values, you can use the Tint panel. You can also create palette styles, such as night and day styles.

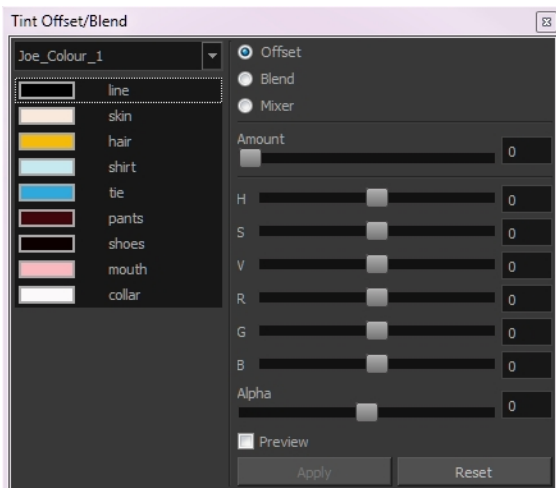

How to mix colours

1. In the Colour view, select the palette that contains the colours you want to offset or blend.

2. Do one of the following:
 - From the Colour View menu, select **Palettes > Tint Panel**.
 - Right-click and select **Tint Panel**.

The Tint Blend/Offset panel opens.

3. Select one or more colours to modify in the colour list. To select all the colours, press Ctrl + A (Windows/Linux) or ⌘ + A (Mac OS X).

4. Select **Preview** option.

5. Select the **Offset**, **Blend**, or **Mixer** option.

Parameter	Description
Offset	Offsets the selected colours by the adjustments made using the HSB and RGB sliders. Use the Amount slider to adjust the degree of offset. Use the Alpha slider to adjust the opacity of the selected colour.
Blend	Blends the selected colours with the colour swatch in the top-right corner. Use the Amount slider to adjust the degree of blend. A blend of 100% turns the selected colours into the same colour as the swatch. Adjusting the HSB and RGB sliders affect the swatch colour, which in turn affects the selected colours on the left. Use the Alpha slider to adjust the opacity of the swatch.
Mixer	Select a Base and Tint colour to form a third colour swatch. Use the slider just beneath to mix the Base and Tint colours by different amounts. This will affect the mixed swatch whether it is selected or not. Select either the Tint or Base swatch and use the HSB and RGB sliders to adjust its colour. This will affect the mixed swatch colour, which in turn affects the selected colours on the left.

6. Click **Apply**.

Protecting Colours

When you are finished inking one colour, you can lock it so if you ever paint over it accidentally, the work already done will not be affected. You can also use the Protect Colour feature to block the filling colours if you painted all of the animation in Line Art and you plan to repaint the lines.

When painting, the Respect Protected Colour option is enabled by default. In the Colour view, you can protect In the Colour view, you can protect a colour swatch to avoid repainting or unpainting the zones linked to that swatch. If you using the Paint tool and this option is deselected, you will repaint or unpaint the protected colours on your drawings until you enable the option again.

How to protect colours

1. In the Colour view, select the colour to be protected.

2. Do one of the following:

- Right-click and select **Protect Colour**.
- From the Colour view menu, select **Colours > Protect Colour**.

A red bar appears beside the colour to indicate that it is locked.

How to enable the Respect Protected Colours option

1. Do one of the following:
 - In the Paint tool properties, click the Respect Protected Colour  button.
 - From the top menu, select **Drawing > Colour Protection > Respect Colour Protection**.
 - Press Shift + S.

Copying and Pasting Colours

When you're creating palettes, you may want to copy colour swatches or their values and paste them in other palettes to save time. You can also quickly copy a colour value from a palette in your scene to a selected colour swatch in a different palette.

You can copy a selected colour swatch and paste it as a clone. Since it produces a clone colour swatch, it is impossible to use the Paste as Clone command in the same palette as you copied the original colour swatch from.

If you would like to keep a reference file of some colour IDs or use them with custom plug-ins, you can copy the colour swatch IDs. Here is an example of colour ID: **075cf5b552401130**.

```
ToonBoomAnimationInc PaletteFile 2
Solid   Black           0x075cf5b15fe006a1  0  0  0 255
Solid   White           0x075cf5b15fe006a3 255 255 255 255
Solid   Red             0x075cf5b15fe006a5 255  0  0 255
Solid   Green           0x075cf5b15fe006a7  0 255  0 255
Solid   Blue            0x075cf5b15fe006a9  0  0 255 255
Solid   Custom          0x075cf5b15fe006a8  0  0 150 255
Solid   "Vectorized Line" 0x0000000000000003  0  0  0 255
```

How to copy and paste colours

- In the Colour view, select one or more colours to copy.
 - In the Colour view, click the Edit Palette Mode  button to edit the colour list.

- In the Colour View menu, select **Colours > Copy** or press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).
- In the Palette list, select the palette in which you want to paste the colours.

- From the Colour View menu, select **Colours > Paste as New Colours** or press Ctrl + V (Windows/Linux) or ⌘ + V (Mac OS X).
 - To paste the colour values of the copied swatch over an existing colour swatch, select **Colours > Paste Colour Values**.

How to clone a colour swatch

1. In the Colour view, select the colour swatch you want to clone.
 - In the Colour view, click the Edit Palette Mode  button to edit the colour list.
2. From the Colour View menu, select **Colours > Copy** or press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).
3. In the Colour view, select the colour palette you want to paste the clone into or create a new palette.
4. From the Colour View menu, select **Colours > Paste as Clone**.

The cloned colour swatch appears in the palette.

How to copy a colour ID

1. In the Colour view, select the colour swatch you want to get the ID from.
 - In the Colour view, click the Edit Palette Mode  button to edit the colour list.
2. From the Colour View menu, select **Colours > Copy Colour ID** or press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).
3. Paste the copied value as plain text in the desired document.

Changing the Colour Display Mode

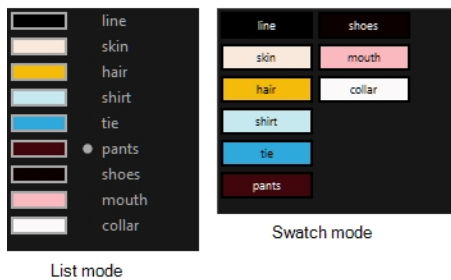

The Colour view has two display modes:

- List
- Swatch

You can also display the RGB values and names of your solid colour swatches instead of only the name. This option is not available when displaying the colours in Swatch mode.

How to switch between the display modes

1. From the Colour View menu, and do one of the following:
 - Select **Colours > Swatch Mode** to display the swatches.
 - Deselect **Colours > Swatch Mode** to display the colour list.

How to display the swatch colour values

- From the Colour View menu, select **Palettes > Display Colour Values**.

The solid colour swatches' RGB values are displayed between the colour swatch and its name. The gradient colour swatches will be identified as (gradient).

About Palettes

T-ANIMPA-003-001

In animation, specific colours are used to paint each part of each character. In order to maintain absolute consistency, a colour palette is created for each character, prop and effect throughout the production. This is referred to as a *master palette*.

Master palettes contain a colour swatch for each area to colour. Each swatch stores a colour in precise levels of red, green, blue and opacity, the latter which is referred to as *alpha*.

Using a master colour palette has many benefits, including:

- Each character consistently retains their dedicated colours.
- You cannot accidentally use a colour which is not in the master palette.
- Standardization and colour consistency throughout the production
- Multiple artists can use the same colour palette and produce the same results.

Harmony uses palettes to hold all the colours needed to paint your elements, allowing complete control and consistency in the painting process.

A palette is created by assigning a set of colours to each character, prop or effect. You will create a new palette and add a new colour, known as a *colour swatch*, for each zone of the character, such as the skin, hair, tongue, shirt, pants, and so on.

In Harmony, palettes are individual files that you can copy, transfer, and store. Palettes have a * .*p1t* file name extension.

When you modify the colour of an existing swatch, it automatically updates all the zones painted with this swatch throughout the entire project. The colour swatch has a unique ID number that associates it with the painted zones. This way, you can change the look of your character at any time without having to repaint it!

Another advantage of this system is that you can create complete palettes for different lighting situations. For instance, in addition to the regular palette for a character, you could have one for that character in the rain using colours that are duller and less vibrant than the dry daytime colours, or yet another for using in a night scene. Using palettes linked to your character in this way allows you to instantly change its colouring to suit the mood and atmosphere of the scene without tediously repainting each element.

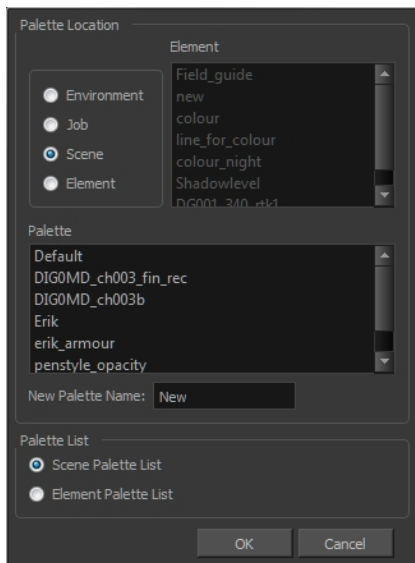

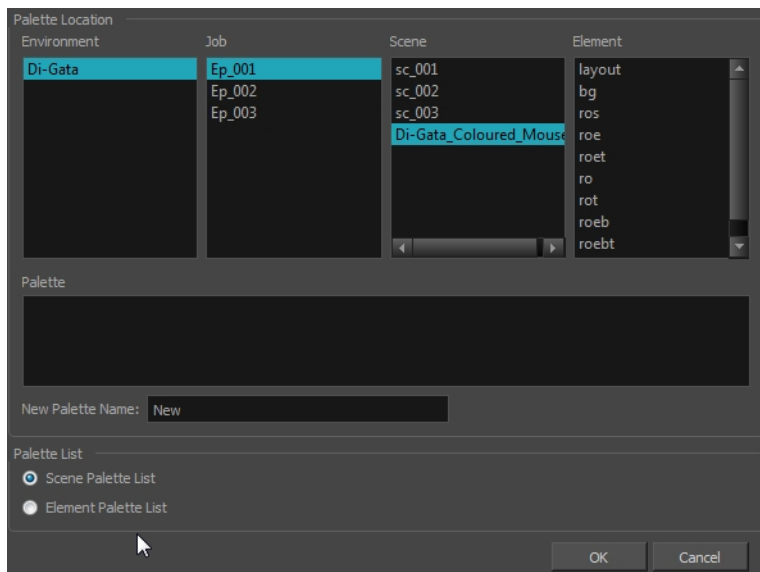

Erik, Di-Gata Defenders © Nelvana Limited, Corus® Entertainment Inc.

In Harmony, palettes are individual *.plt files that can be copied, transferred and stored. When a palette is created from Harmony, it needs to be stored somewhere. By default, the palette file is stored in the scene directory in a palette-library folder unless you specify a different location.

There are four locations where you can find palette-library folders:

- **Element:** The Palette Library folder is stored directly in the drawing Element folder.
- **Scene:** The Palette Library folder is stored directly in the Scene folder.
- **Job:** The Palette Library folder is stored in a Job folder contained in the Scene folder.
- **Environment:** The Palette Library folder is stored in an Environment folder contained in the Scene folder.

By default, the palette is stored at the scene level. For simple projects and standalone projects, it is recommended to keep it as is. If you work with a larger studio, it is recommended to verify with them on the file structure.

This existing structure is compatible with Harmony Server. Harmony's database has a leveled structure starting from the Environment down to the Element. Its client-server configuration allows all data, such as palettes and scenes, to be shared between a series of client machines.

Element Level

Working with Harmony Stand Alone, the Element level is very useful when there are a lot of different palettes. When a colour model drawing is created, it is stored in its element folder. By storing the corresponding palette file with the colour model, the colourist can load them both from the same location. This also creates a more organized structure.

Scene Level

Working with Harmony Stand Alone, a palette file can also be saved at the scene level, so that all of the palettes from the scene are stored together. The palette naming must be structured so the colourist or character builders can find the correct one. Saving the palettes at the scene level makes it very easy to back up the palettes and retrieve their location.

The scene level can also be useful for cut-out animation. Instead of creating a colour model scene that includes all of the characters, props, effects, and location, the colour palette or model will often be directly imported to, or created in, the character building scene. Just as with a cut-out character building scene, each element uses the same palette so it would not be efficient to save the palette inside one element. Instead, it is saved at the scene level. This prevents a palette overload because all of the models are in different scenes. It also allows each scene to have its own set of palettes corresponding to its model.

When working on a cut-out animation production, it is highly recommended that you work with the Scene level.

Where to Save the Palette File

The palette storage location depends on the type of production and the backup plan being used. Some studios like to store their palettes at the Element level and others at the Environment level as this will not create a problem so long as the scene is in the Harmony structure. In fact, as long as the Harmony structure is maintained it can be stored at any level. However, difficulties may occur when the scene is backed up or transferred to another studio or database and removed from the structure.

What happens when you export a palette file?

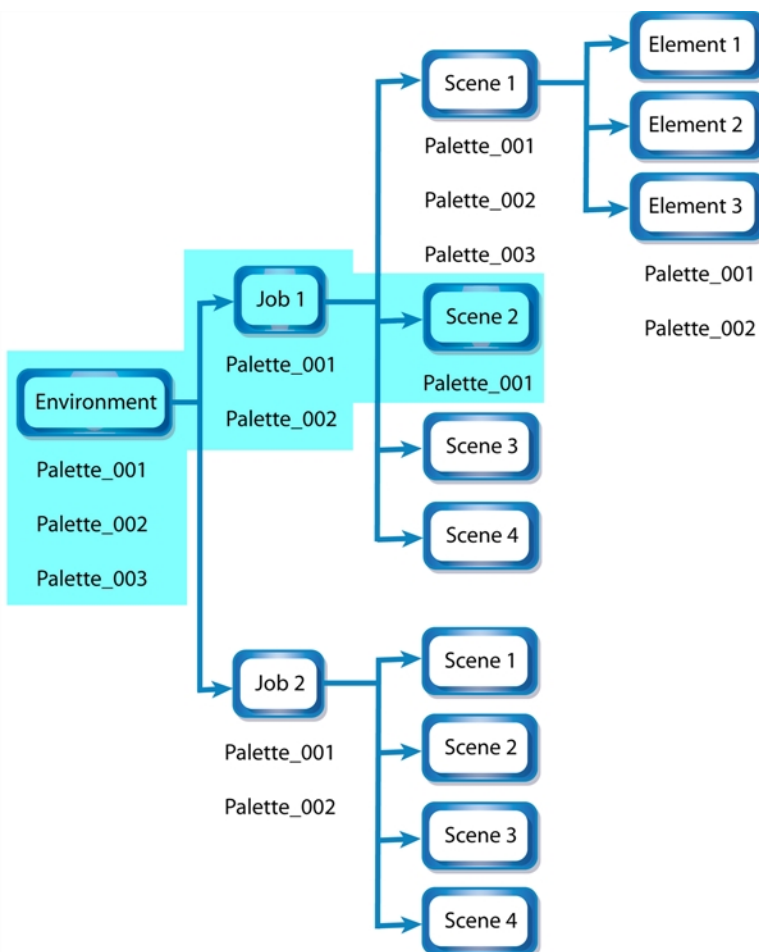

It is important to understand what is happening to a palette file when the scene is exported.

Because of the Harmony client-server configuration, all of the data can be shared through all of the scenes in the database. This also includes the palette files, even if they are stored at the Element, Scene, Job, Drawing or Environment level. The palette files can be accessed from any scene of any project.

When you export scenes from Harmony to either archive or send them to other users or studios, the palettes stored in external scenes, jobs or environment will **NOT** be exported.

An exported scene will carry palettes stored in its own Element's Palette Library, scene's palette library, the Job and the Environment where it is stored. Any other palette from other Environments, Jobs, Elements or Scenes (even from the same job) will **NOT** follow. Instead a recovery palette will be created when the scene is reopened in another Harmony system. A recovery palette is a local palette created by the system when palettes and colours are missing. This palette is no longer shared with the rest of the project.

For example, in the following chart, if you export Scene 2 from Job 1, the package will carry the palettes from Scene 2, Job 1 and Environment. It **WILL NOT** carry the palettes from Element 3 in Scene 1, Scene 1 and Job 2. If Scene 2 was linked to any of these, the system will create a recovery palette the next time Scene 2 is opened in another Harmony system.

The best place to store your palette is:

- Environment level for a movie or series
- Job level for a publicity or small project

- Scene level for a student exercise

To store your palette with their colour models, you can use the Element level, however, it will require more structure when exporting the scenes. The scene will have to be exported along with its colour model scene. The other studio you are working with must recreate an identical structure to yours, then import the received scenes into the same location as you have them in order to maintain the links.

Palette Backup

When sharing palettes between scenes, some users may accidentally modify the colours, even though the palettes are locked by default. That is why it is a good idea to copy and back up your palette libraries and master palette directories.

When a palette file is copied, it automatically becomes a clone palette, so there will not be any trouble replacing an altered file. Harmony automatically updates all of the files and drawings linked to it.

About the Palette List

The Colour view has two modes: basic and advanced.

- **Basic Mode**

The Colour view's basic mode only shows the Colour list. When you open Toon Boom Harmony, you only see the colours available in the Default palette which contains six basic colour swatches and is automatically named the same as your scene. For simple projects, you can manage with the default palette, but for movies, series, or shorts it is recommended that you create palettes for your characters. To create a palette, you have to switch to the Advanced mode of the Colour view and show the Palette list.

- **Advanced Mode**

The Advanced mode displays the list of all palettes that are linked to the scene. To create palettes for your characters, you must display the Palette list.

Basic mode

Advanced mode

A palette list is a file containing all of the links to the original palette files. Every drawing layer has a palette list. The scene also has a palette list. For example, a drawing layer can use three different palettes stored in three different locations, while another drawing layer can use two of these palettes plus another one coming from another scene. The palette list keep track of the locations of the palettes.

There are two types of palette lists:

- **Scene Palette List**

The Scene Palette list is mainly used with cut-out animation, but is also very useful for paperless and traditional animations. A cut-out character will often be divided into 20 to 30 different drawing elements that use the character's master palette.

The palette list is stored at the scene level instead of the Element directory. This way, all palettes linked to this list will appear in every drawing element created in the scene. There is no need to manually load the palette in each element.

The Scene Palette list is the simplest one to use. By default, Toon Boom Harmony is set to use only Scene Palette lists.

- **Element Palette List**

In Toon Boom Harmony, you can switch to Advanced Palette List mode and choose to save your palette at an element's level. The Element Palette list is mainly used with traditional and paperless animation. Unlike cut-out animation, all columns (drawing elements) contain different characters, props, backgrounds, and effects. The Element Palette list is used when you do not necessarily want all of the palettes for all of your elements linked in every column.

The palette list is stored in the drawing element's directory instead of directly in the Scene level. This ensures that the links to the palettes appear only in the appropriate element. If you prefer to access a global palette list, link your palettes to the Scene Palette list.

When you are using several cloned palettes that are related to the same original palette, Toon Boom Harmony uses the palette located highest in the list to determine the colour of the painted zones—see [Cloning a Colour Palette](#) on page 501.

How to reorder palettes in the Palette list

Do one of the following:

- ▶ From the Colour View menu, select **Palettes > Move Up** or **Move Down**.
- ▶ In the Palette list, click the Up  and Down  buttons.

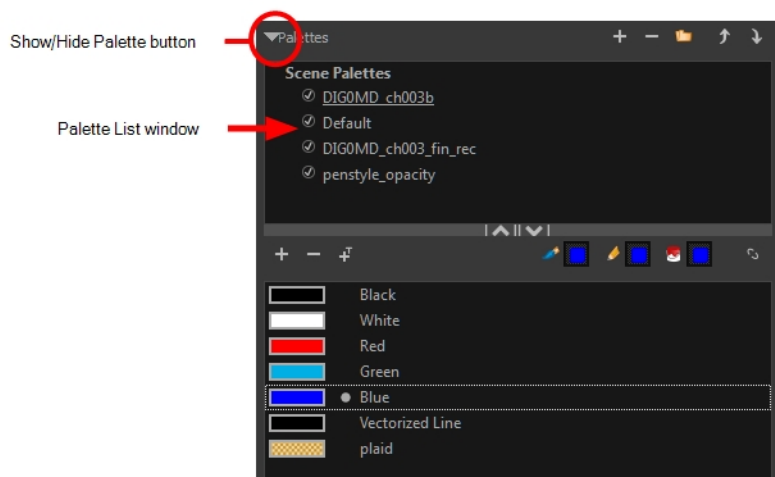

Showing and Hiding the Palette List

You can show or hide the palette list in the Colour view.

How to show or hide the Palette list

- In the Colour view, click the Show/Hide Palette List View  button to expand or collapse the Palette List area.

The Palette List window opens and displays all your palettes.

Locking and Unlocking the Palette List

To prevent users from accidentally removing a link to a palette, the palette lists are locked. To link or create a new palette, the palette list must first be unlocked.

How to lock and unlock to the palette list

- ▶ From the top menu, select **Edit > Edit Palette List Mode**.

A grey pencil appears on the top-right corner of the Palette list to indicate that it can be modified.

Enabling the Advanced Palette Mode

You can set up the Advanced Palette Lists option in the Preferences panel. This allows you to see the Element and Scene palette lists.

How to set the Advanced Palette Lists mode

1. Do one of the following:
 - From the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
 - Press **Ctrl + U** (Windows/Linux) or **⌘ + U** (Mac OS X).
2. Select the **Advanced** tab.
3. In the Advanced Options section, select the **Advanced Palette Lists** option.
4. Click **OK**.

Creating a Colour Palette

You can create a palette in either Basic or Advanced mode.

By default, Toon Boom Harmony is set to the Basic mode. For simple productions, it is recommended to use the Basic mode. This setting stores the palettes automatically for you and saves them at the Scene level. When you use the Advanced Palette Lists mode, you can decide at which level you want to store your palettes: Environment, Job, Scene, or Element.

If you are using Harmony Server, see [About Palettes on page 483](#).

How to create a new palette (Basic Palette Lists mode)

- From the Colour view menu, select **Palettes > New** or click the New Palette **+** button.
 - Make sure you have the rights to modify the palette list. If not, select **Edit > Edit Palette List Mode**.

The Create Palette dialog box opens.

- Enter the palette name according to the model.

- Click **OK**.

The palette appears in the drawing element's palette list.

How to create a palette from the Advanced Palette Lists mode

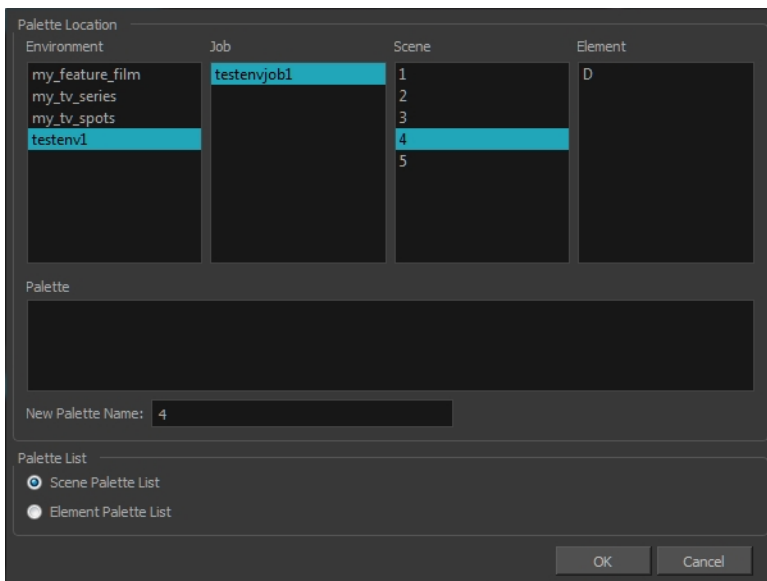

- In the Timeline or Xsheet view, select the drawing that requires a palette.
- Make sure that you have the necessary rights to modify the palette list. If you do not, select **Edit > Edit Palette List Mode**.
- In the Colour view, click the **Show Palette List View** button to display the palette list.

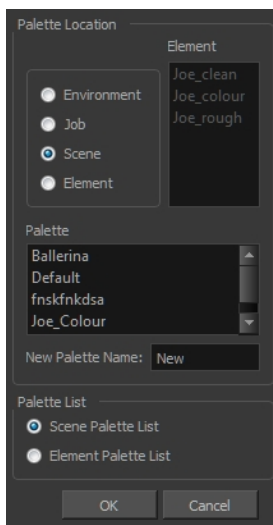

4. Do one of the following:

- From the Colour view menu, select **Palettes > New**. Before you can create a palette in the Advanced Palette Lists mode, you must first set your preferences to Advanced Palette Lists mode in the Preferences dialog box—see [Enabling the Advanced Palette Mode on page 493](#).
- Click the Create Palette **+** button.

The Palette Browser: Create Palette dialog box opens.

Harmony Server

Harmony Standalone

5. Select the level to store the palette file.

- **Environment:** The palette-library folder is stored in the scene's parent environment folder.
- **Job:** The palette-library folder is stored in the scene's parent job folder.
- **Scene:** The palette-library folder is stored directly in the scene folder.
- **Element:** The palette-library folder is stored directly in the drawing element folder.

When you select a level that has a palette stored in it, the palette names are displayed in the Palette field.

Harmony Server

6. Name the palette. There is no need to add the suffix "palette" to the as it is always recognized as a palette file.

7. Select a Palette List option.

The Scene Palette List is mainly used with cut-out animation. A cut-out character will often be divided in twenty to thirty different drawing elements that use the character's master palette.

The palette list is stored at the scene level instead of the Element directory. This way, all palettes linked to this list will appear in every drawing element created in the scene. There is no need to manually load the palette in each element.

The Element Palette List is mainly used with traditional and paperless animation. Unlike cut-out animation, all columns (drawing elements) contain different characters, props, backgrounds and effects. The Element Palette List is used because you do not necessarily want all of the palettes for all of your elements linked in every column.

The palette list is stored in the drawing element's directory instead of directly in the Scene level. This ensures that the links to the palettes appear only in the appropriate element. If you prefer to access a global palette list, link your palettes to the Scene Palette List.

8. Click **OK**.

The new palette appears in the palette list.

Renaming a Colour Palette

T-ANIMPA-003-003

You can rename a colour palette to keep your list organized.

How to rename a palette

1. In the Colour view, select the palette to rename.

2. Do one of the following:
 - Right-click and select **Rename**.
 - From the Colour View menu, select **Palettes > Rename**.
3. In the Rename dialog box, give the palette a new name and click **OK**.

Removing a Colour Palette

You can remove palettes from your Palette list if they're not needed in your scene. The actual palette file will not be deleted and you can reimport it in your Palette list later on.

How to remove a palette

1. In the Colour view, select the palette to remove.

2. Do one of the following:
 - From the Colour View menu, select **Palettes > Remove**.
 - Right-click on the selected palette and select **Remove**.
 - Click the Remove Palette  button located above the Palette list.

If the palette was used in your scene, the zones painted with its colours turn red.

Duplicating a Colour Palette

A duplicated palette is a simple copy of the original palette. It uses the same names, colour values, but has a different ID and is independent from the original palette. This ensures that both palettes are completely independent.

This option is used when there are similar models and you want to avoid recreating and naming all the colours. You can change the values and the names afterward without affecting the original palette. You can also keep some RGBA values, such as the eyes, teeth, tongue, inside mouth, etc.

How to duplicate a palette

1. In the Colour view, select the palette to be duplicated.

2. Do one of the following:
 - From the Colour menu, select **Palettes > Duplicate**.
 - Right-click on the selected palette and select **Duplicate**.

The Palette Browser: Duplicate Palette window opens.

3. If you are in Advanced Palette List mode, select the palette storage level—see [About Palettes on page 483](#).

4. In the New Palette Name field, name the palette.

5. In the New Palette Name field, name the palette.
6. Click **OK**.

The palette appears in the palette list.

Cloning a Colour Palette

A character usually has only one master palette, although there are times when the characters are placed in different lighting conditions and require a different colour shading. The night palette is a popular choice when a scene or sequence changes from day to night. It can be difficult and time-consuming to repaint everything and creating two independent palettes can be quite complex. As an alternative, Toon Boom Harmony provides clone palettes.

The clone palette is a copy of the master palette. The colours in each palette have the same properties. The colours have the same identification number pointing to the same colour zones, but they can have different names and RGBA values. Depending on the palette (night or day) you're currently using, the painted drawing will update. So there's no need to repaint the animation. All you have to do is create or import a clone palette (palette style).

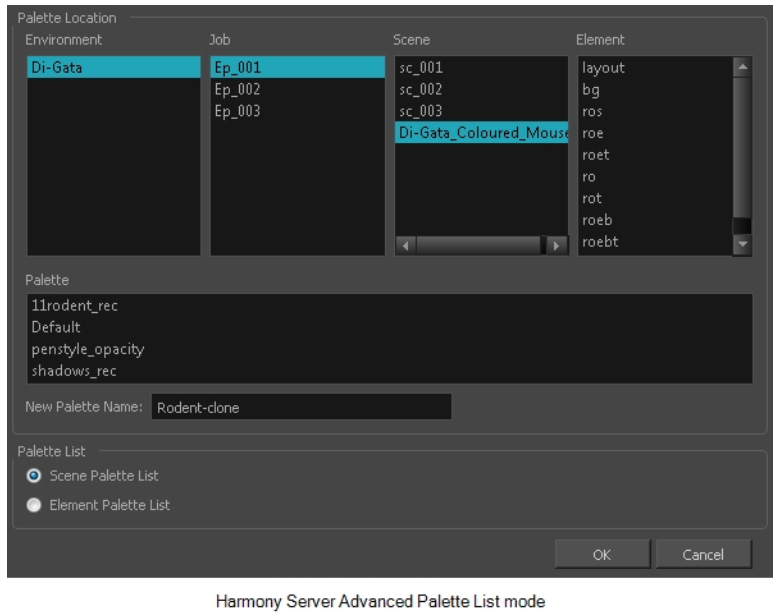

How to clone a palette

1. In the Colour view, select a palette to clone.

2. From the Colour menu, select **Palettes > Clone** or right-click and select **Clone**.

The Palette Browser: Clone Palette dialog box opens.

3. If you're in Advanced Palette List mode, select the palette storage level—see [About Palettes](#) on page 483.

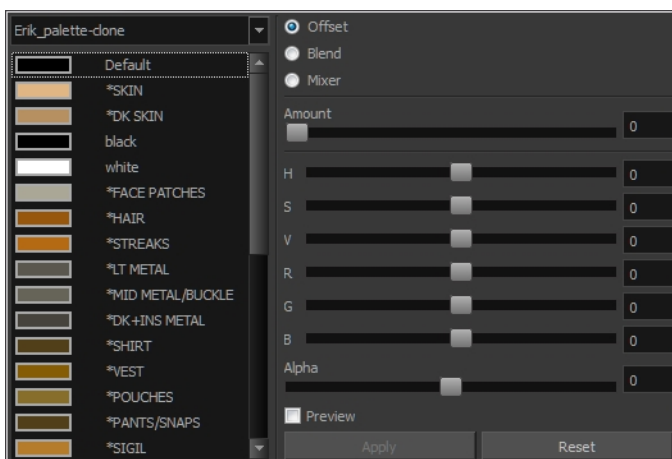

4. In the New Palette Name field, name the palette. We recommend keeping the "-clone" in the name.
5. Click **OK**.

The cloned palette appears in the palette list.

6. In the Palette list, select the clone palette you created to offset or blend colours—see [Mixing Colours on page 477](#).
7. From the Colour View menu, select **Palettes > Tint Panel** or right-click and select **Tint Panel**.

The Blend/Offset Tint panel opens.

8. Select one or more colours to modify. You can select all your colours by pressing **Ctrl + A** (Windows/Linux) or **⌘ + A** (Mac OS X).
9. Offset, blend, or mix the colours using the sliders and increasing the Amount value.

10. Select the **Preview** option to see a preview of the colours while you adjust them.

NOTE: You can also modify the colours individually with the Colour Picker window.

About Linking and Importing Palettes

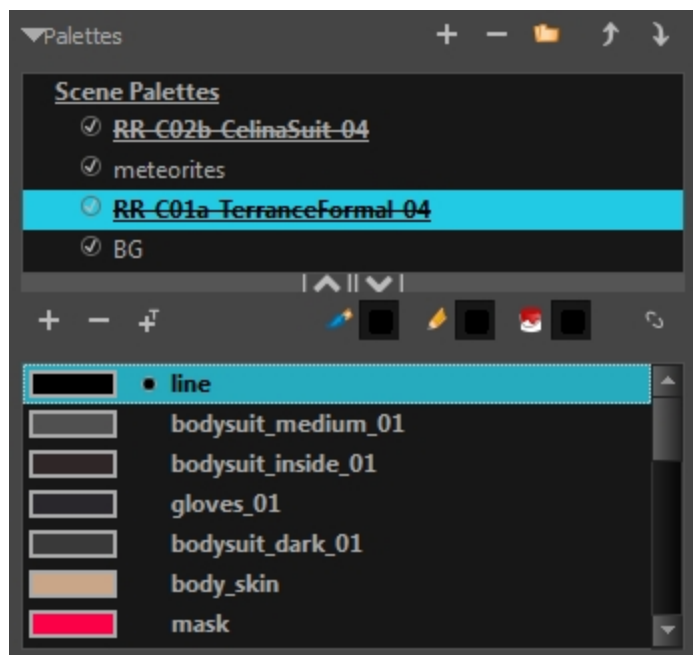

Before you start colouring work such as ink and paint or even creating new colour models, you may want to load existing colour palettes to your scene. You can do so by importing colour palettes to your palette list, or by linking them to your palette list.

Importing a colour palette creates a copy of the palette file in your scene's palette folder, then adds it to your scene's palette list. Linking to a palette adds the palette to your scene's palette list, but from its original location. With the latter method, you can source the colors for your characters and backgrounds from their original model, and make modifications on your models that will apply to all your scenes.

On Harmony Server, you can link to a palette file from any scene, job or environment in your database. As a result, you can link to a palette from the scene in which you created your character and its original palette, or you can store the palettes used by your production at the job or environment level so they can be shared between scenes from a common palette library.

If you are storing palettes in element palette lists, you can link a palette from one element's palette list to another element's palette list. This allows you to share palette files between two or more elements without storing them in the scene's palette list.

If a palette file is missing, it will still appear in the palette list for that scene or element, with a strike through across its name. If you performed the automatic colour recovery for that palette, when the scene was opened, the colours of that palette will be made available in your scene.

The palette list displays icons next to each palette to indicate how it is linked to in the palette list.

Icon	Description
✓	Indicates that the palette is safe. There won't be any problems once the scene is exported. For example, the palette file is stored in the scene folder and is linked to the Scene Palette List.
⊗	Indicates that the palette file is stored in a directory external to the scene's structure. The palette file is probably stored in a Master Palette directory on a hard drive external to the

	palette-libraries planned for the palette storage. The warning in this case is that if you move your Master Palette directory to another location, you may lose the palette in your scene.
	Indicates that a palette file stored in a level such as Element, Scene, Job or Environment is linked to a Palette list that is not on the same level. For example, a palette file is stored into the Environment folder and is linked to the Element Palette list. The palette is shared.
	Indicates a potentially dangerous situation. Problems may occur when trying to export or link to the palette file. For example, a palette file is stored into the element folder and is linked to the Scene Palette list. The issue in this case is that if you decide to delete the layer containing the palette, it will be lost from your scene.

Importing a Colour Palette

T-ANIMPA-003-005

You can import an existing colour palette in your project.

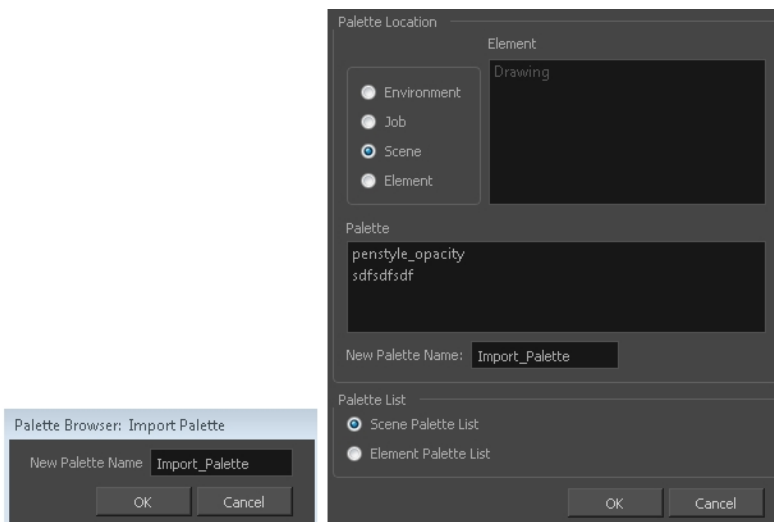

How to import a palette into your project

- Do one of the following:
 - From the Colour menu, select **Palettes > Import**.
 - Right-click and select **Import**.

The Browser window opens.

- Browse for a palette file located (***.plt**) on your hard drive. You will generally find the palettes in your project's palette-library directory.
- Click **Open**.

The Palette Browser opens.

Basic Palette List mode

Harmony Standalone Advanced Palette List mode

Harmony Server

4. If you're in Advanced Palette mode, select the level where the palette file is stored—see [About Palettes on page 483](#).
5. If you're in Advanced Palette mode, select the palette list linking level by enabling either **Scene Palette List** or **Element Palette List**—see [About Palettes on page 483](#).
6. In the New Palette Name, name the imported palette.

The palette appears in the Colour view and the file is copied in your project.

Linking a Colour Palette

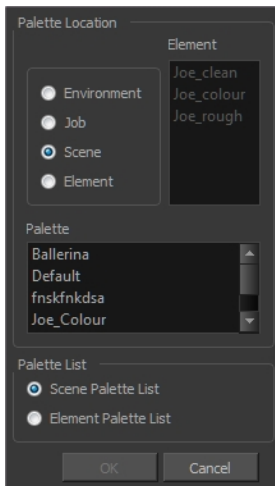

T-ANIMPA-003-004

You can link a palette from its original location as long as it is located in the Harmony structure.

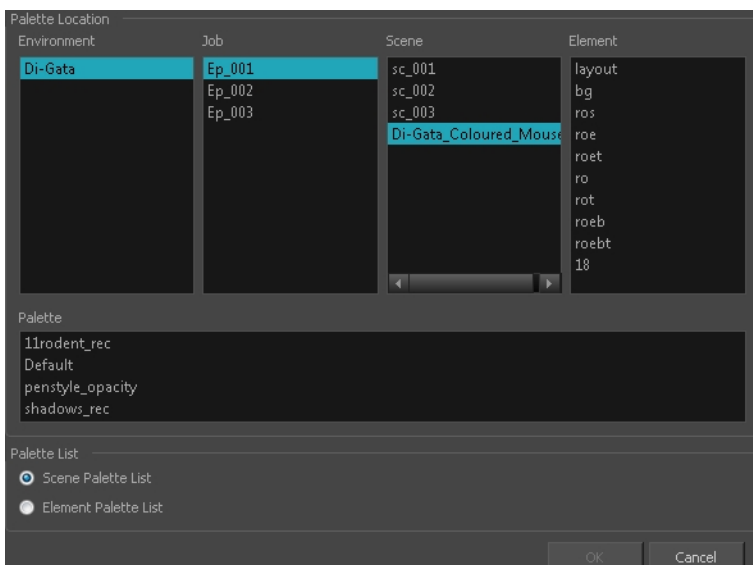

How to link a colour palette

- Do one of the following:
 - From the Colour View menu, select **Palettes > Link**.
 - Right-click and select **Link**.
 - Click the Import  button.

The Palette Browser: Link Palette dialog box opens.

Harmony Standalone

Harmony Server

2. Select the level where the palette file is stored—see [About Palettes on page 483](#).
3. Select the palette list linking level by enabling either **Scene Palette List** or **Element Palette List**—see [About the Palette List on page 488](#).

The palette appears in the Colour view.

Palette Operations

When you start Toon Boom Harmony connected to the database, you can access the Palette Operations dialog box which lets you clone, rename, or delete palettes.

Opening the Palette Operations Dialog Box

You can open the Palette Operations dialog box in Harmony Server.

How to open the Palette Operations dialog box

1. Start and log in.
2. Close the Database Selector dialog box.
3. From the top menu, select **Tools > Palette Operations**.

The Palette Operations dialog box opens.

Cloning a Palette in the Palette Operations Dialog Box

From the Palette Operations window, you can clone palettes in Harmony Server.

How to clone a palette in the Palette Operations dialog box

1. Select the palette you want to clone at the location and level in which it was stored.

2. Click **Clone**.

A Warning dialog box opens.

3. Select the **Don't show this message again** option if you do not want to see this message every time you perform this operation.
4. Click **Yes**.
The Palette Browser dialog box opens.
5. Select the level to store the palette file.

Harmony Server

6. Name the palette. There is no need to add the suffix "palette" to the name as it is always recognized as a palette file.

7. Select a Palette List option.

The Scene Palette List is mainly used with cut-out animation. A cut-out character will often be divided in twenty to thirty different drawing elements that use the character's master palette.

The palette list is stored at the scene level instead of the Element directory. This way, all palettes linked to this list will appear in every drawing element created in the scene. There is no need to manually load the palette in each element.

The Element Palette List is mainly used with traditional and paperless animation. Unlike cut-out animation, all columns (drawing elements) contain different characters, props, backgrounds and effects. The Element Palette List is used because you do not necessarily want all of the palettes for all of your elements linked in every column.

The palette list is stored in the drawing element's directory instead of directly in the Scene level. This ensures that the links to the palettes appear only in the appropriate element. If you prefer to access a global palette list, link your palettes to the Scene Palette List.

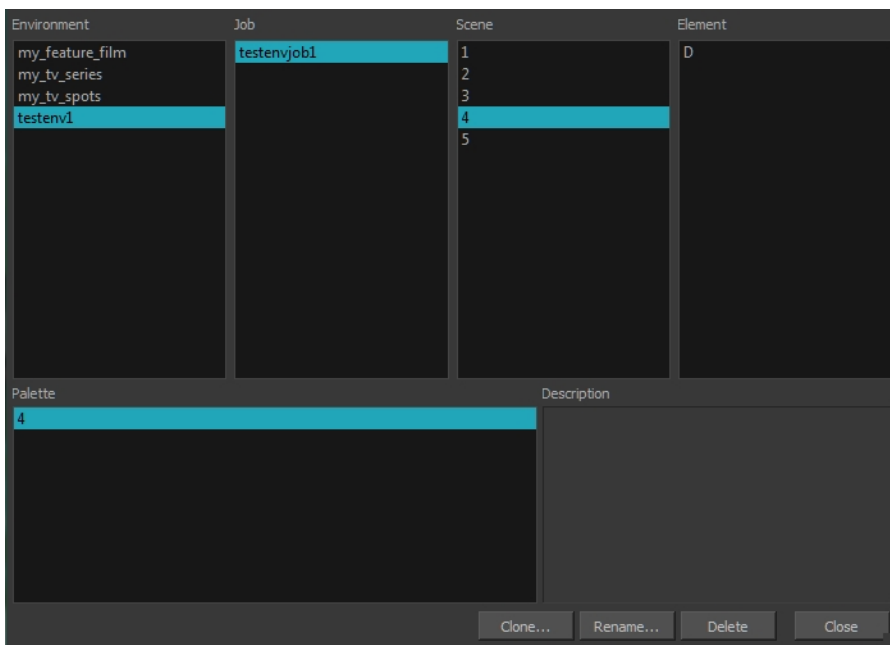

8. Click **OK**.

Renaming a Palette in the Palette Operations Dialog Box

You can rename palettes in the Palette Operations dialog box in Harmony Server.

How to rename a palette in the Palette Operation dialog box

1. Select the palette you want to rename at the location and level in which it was stored.

2. Click **Rename**.

A Warning dialog box opens.

3. Select the **Don't show this message again** option if you do not want to see this message every time you perform this operation.
4. Click **Yes**.

The Rename Palette dialog box opens.

5. Type in a name for the palette.
6. Click **OK**.

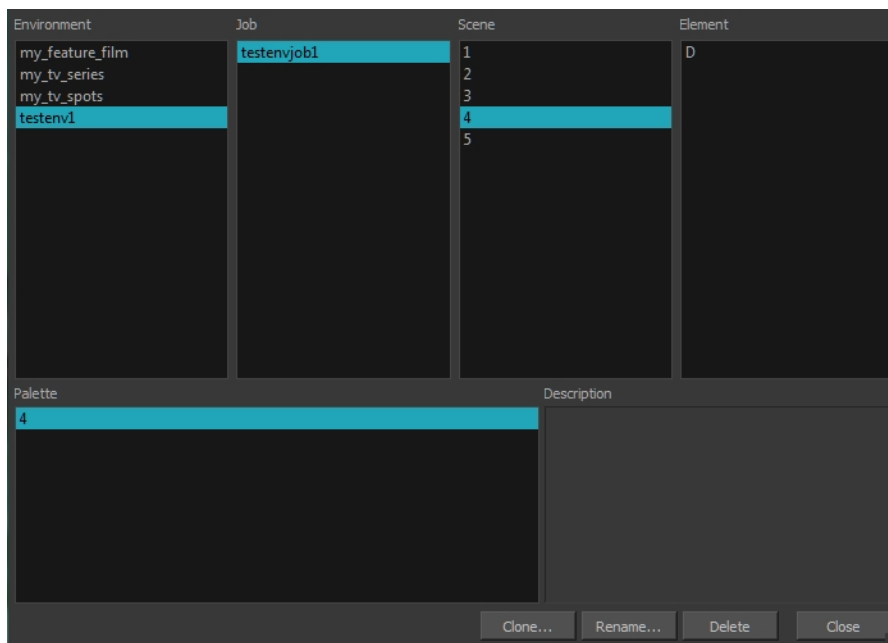

Deleting a Palette in the Palette Operations Dialog Box

You can delete palette files from the Palette Operations dialog box in Harmony Server.

How to delete a palette in the Palette Operation dialog box

1. Select the palette you want to delete at the location and level in which it was stored.

2. Click **Delete**.

A Warning dialog box opens.

3. Select the **Don't show this message again** option if you do not want to see this message every time you perform this operation.

NOTE: It is not recommended to disable the warning message as deleting a palette cannot be undone.

4. Click **Yes**.

About Painting

Harmony is optimized to ink and paint drawings efficiently. Since most of the drawings are vector-based, the colour zones are completely filled and there are no scattered spots left blank. Also, there are some actions that can be applied on an entire animation sequence at once, like dirt removal, some colour filling, line repainting, and so on.

When traditional animation is traced, cleaned up, scanned in and properly exposed, it's time for the ink and paint process. This consists of cleaning all dirt and hair (for example, dust that was in the scanner, dots that do not belong in the drawing, extra floating artwork around the drawing that must be removed), painting the lines and filling the colours in the empty zones on an entire animation sequence.

Di-Gata Defenders © Nelvana Limited, Corus® Entertainment Inc.

For paperless animation, the drawings are cleaned up directly in Harmony, so there is generally no dirt to clean, only painting and inking.

Harmony uses palettes to hold all the colours you need to paint your elements. A palette is created by assigning a set of colours to each character, prop or effect. The colour styling artist will create a new palette and add a new colour for each zone of the character, such as the skin, hair, tongue, shirt, pants, and so on. Each colour is known as a *colour swatch*—see [About Palettes](#) on page 483.

Di-Gata Defenders © Nelvana Limited, Corus® Entertainment

About Colour Models

Once you have a fully painted drawing, you can use it as a colour model and load it in the Model view. That drawing can be used and loaded in any of your Harmony scenes—see [Painting Drawings on page 531](#).

Once a drawing is loaded in the Model view, you can use the Model view Dropper to select a colour from the model and use it to paint in your Camera or Drawing view without having to pick the colour from the colour palette.

You can do more than just copy colours from a colour model. Harmony gives you the ability to copy parts of the character directly from its colour model and paste these elements into the Drawing or Camera views.

Loading Colour Models

You can load any TVG drawings in your Model view. To avoid browsing for models every single time you work on your scene, you can store default models in your scene and load those.

How to load a colour model from the Timeline or Xsheet view

1. In the Timeline or Xsheet view, select a drawing (*.tvg).

2. Bring the model into the Model view by doing one of the following:
 - In the Timeline view, drag the selected drawing and drop it directly in the Model view.
 - From the Model View menu, select **Use Current Drawing as Model**.

NOTE: The Use Current Drawing as Model button is not part of the default Model View toolbar. To add the Use Current Drawing as Model button to the Model toolbar, right-click in the Model view toolbar and select **Customize**. Drag the Use Current Drawing as Model  button from the Available Tools column and move it to the right (Toolbar) column. Click **OK**.

- In the Model View toolbar, click Current Drawing  button.

The model appears in the Model view.

How to browse for a colour model drawing on your hard drive

1. Do one of the following:
 - In the Model View toolbar, click the Import Model  button.
 - From the Model View menu, select **Import Model**.
 - Select **File > Import > Colour Model**.
2. In the Browser window, browse for any *.tvg drawing file on your hard drive or in the database for Harmony Server.
3. Click **Open**.

The model appears in the Model view.

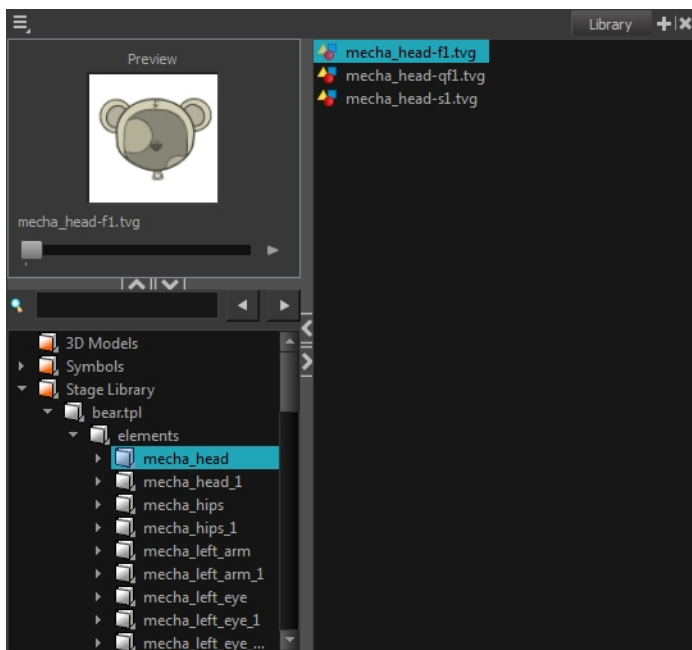

How to load the default models

1. In your scene's folder, create a new folder and name it `models`.
2. On your hard drive, copy the *.tvg drawing file you want to use as colour models in your scene.
3. Paste the copied models in the `models` folder you created.
4. Do one of the following:
 - From the Model View menu, select **Load Default Models**.
 - In the Model View toolbar, click the Load Default Model  button.

NOTE: The Load Default Model button is not part of the default Model View toolbar. To add the Load Default Model button to the Model toolbar, right-click in the Model view toolbar and select **Customize**. Drag the Load Default Model  button from the Available Tools column and move it to the right (Toolbar) column. Click **OK**.

How to load a single drawing from the Library view

1. In the Library view, click the template containing the drawing to import in the Model view.
2. Right-click on the template and select **Open As Folder**.
3. In the Library view's left side, select the template's folder and continuing expanding its subfolders until *.tvg files appear on the right side.

4. In the Library view's right side, select the TVG drawing to import and drag it into the Model view.

How to load a template with multiple drawings from the Library view

1. In the Library view, find the template you want to import in the Model view.
2. In the Library view's right side, drag the template (*.tpl file) and drop it directly in the Model view.
3. Use the Previous Model  and Next Model  buttons in the Model View toolbar to view all the drawings contained in the template. This can often be the front, profile, and 3/4 views of a character.

How to load a symbol from the Library view

1. In the Library view's left side, select the **Symbols** folder.
2. In the Library view's right side, select the symbol you want to use as a model, and drag and drop it into the Model view.

3. Use the Previous Model  and Next Model  buttons in the Model View toolbar to view all the drawings contained in the template. This can often be the front, profile, and 3/4 views of a character.

Clearing Colour Models

You can remove colour models from the Model view.

How to clear a colour model

- In the Model View menu, select **Clear Model** or press Delete.

Copying Colour Models

You can copy pieces or the entire colour model to paste in your scene,

How to copy the entire model from the Model view

1. In the Model View toolbar, select the Select  tool.
2. In the Model view, select your model.

3. From the top menu, select **Edit > Copy Drawing Object** or press **Ctrl + C** (Windows/Linux) or **⌘ + C** (Mac OS X).
4. In the Timeline view, make sure you have the correct layer and frame selected.
5. Select the Drawing or Camera view, then go to the top menu and select **Edit > Paste Drawing Object**, or select the Timeline view and from the top menu, select **Edit > Paste cells in the Timeline** or press **Ctrl + V** (Windows/Linux) or **⌘ + V** (Mac OS X).

The model appears in the selected view.

How to copy part of the model from the Model view

1. In the Model View toolbar, select the Cutter  tool or press **Alt + T**.
2. In the Model view, use the Cutter tool to create a selection around the part of your model that you want to copy.

3. From the top menu, select **Edit > Copy Drawing Object** or press **Ctrl + C** (Windows/Linux) or **⌘ + C** (Mac OS X).
4. In the Timeline view, make sure you have the correct layer and frame selected.
5. Do one of the following:
 - Select the Drawing or Camera view and select **Edit > Paste Drawing Object**.
 - Select the Timeline view and select **Edit > Paste cells in the Timeline** or press **Ctrl + V** (Windows/Linux) or **⌘ + V** (Mac OS X).

The model appears in the selected view.

About Dirt Cleanup

When paper drawings are passed through a scanner, there can be some hair and dirt scattered across them. These lines and dots need to be cleaned. Harmony provides different tools to help get rid of them quickly.

Di-Gata Defenders © Nelvana Limited, Corus Entertainment Inc.

If there are some marks that cannot be removed with the automated tools, you can erase them with the Eraser tool or select them with the Select tool and then delete them. It's always safer to select and delete them than to erase them, so you do not overlook anything.

Removing Dirt

The Remove Dirt tool selects small dots and hairs on the drawing.

Raising the Remove Dirt level will select bigger dots. When selecting larger dots, be careful not to lose small details like pupils and nostrils. Once you have chosen the level, you can apply it to the current drawing or the entire animation sequence. This is a quick way to get rid of most dirt and dust.

During this process, the dirt that will be removed is highlighted in red.

How to use the Remove Dirt tool

1. Do one of the following:
 - From the top menu, select **Drawing > Clean Up > Remove Dirt**.
 - From the Camera or Drawing View menu, select **Drawing > Clean Up > Remove Dirt**.
 - Press Shift + D.

2. Increase the Remove Dirt value by moving the slider to the right.
3. Select the **Apply to All Drawings** option if you want to apply the operation to all drawings in the layer.

Removing Dirt Outside the Selection

The Remove Art Outside Selection option lets you remove any art existing outside a selection. It is recommended that you clean your Colour Art level as well. If you have a stroke accumulation in your Colour Art, it can result in large output files, especially if you work in high-definition resolutions.

How to clean dirt with Remove Art Outside Selection

1. In the Tools toolbar, select the Select  tool.
2. In the Tool Properties view, click the Permanent Selection  button.
3. Draw a selection around the animation making sure to include the entire animation sequence.

4. In the Camera or Drawing View menu, select **Drawings > Clean Up** and one of the following options:
 - **Remove Art Outside Selection** to delete artwork outside your selection on a single drawing.
 - **Remove Art Outside Selection on All Drawings** to delete artwork outside your selection on all the drawings.

The art outside the selection is removed.

Removing the Art Inside the Selection

You can delete any art inside a selection with the Remove Art Inside Selection option. We recommend that you clean your Colour Art level as well. If you have a stroke accumulation in your Colour Art, it can result in large output files, especially if you work in high definition resolutions.

You can simultaneously apply this operation to all your drawings in the layer by using the Remove Art Inside Selection on All Drawings command.

How to clean dirt with Remove Art Inside Selection

1. In the Tools toolbar, click the Select  tool or press Alt + S.
2. To apply the action to your entire animation, click the Permanent Selection  button in the Tool Properties view.
3. In the Camera or Drawing view, draw a selection around the animation. Make sure the area is large enough to include all the zones to be cleaned up on all drawings.
4. From the top menu, select **Drawing > Clean Up > Remove Art Inside Selection** to delete artwork inside your selection on one single drawing. You can also press Delete.
5. To apply the action on all your drawings in the layer, select **Drawing > Clean Up > Remove Art Inside Selection on All Drawings** to delete artwork inside your selection on all the drawings.

Removing Hair

The Remove Hair command lets you remove any small strokes created in the Colour Art layer from very thick lines or filled zones. Increasing the Remove Hair level value will select larger strokes for removal from the drawing.

How to use the Remove Hair tool

1. In the Timeline or Xsheet view, select the drawing containing the drawing to clean.
2. From the top menu, select **View > Show > Show Strokes** to display the invisible lines or press K.
3. In the top menu, select **Drawing > Clean Up > Remove Hair**.

The Remove Hair dialog box opens.

4. Move the slider to the right to increase the number and length of hairs to be selected.
5. Select the **Apply to All Drawings** option if you want to apply the operation to all the drawings in the layer.

6. Click **OK**.

Painting Drawings

T-HFND-004-011

The main tool you will use to paint your drawings with is the Paint tool. The Paint tool can be used in several different modes, which can be customized in the Tool Properties view.

The Paint tool paints closed zones, including brush strokes and pencil lines. If there are gaps in the lines defining a zone, you must close them using the Brush, Pencil, or Close Gap tools or the Automatic Close Gap option.

NOTE: To learn more about the Paint tool options, see the Reference guide .

How to paint drawings

1. In the Timeline or Xsheet view, select the cell on which you want to paint.

2. Do one of the following:

- In the Tools toolbar, click the Paint  tool.
- Press Alt + I.

In the Tool Properties view or Tools toolbar, you can select additional painting modes.

- The Paint  mode paints everything it touches, including empty and filled zones.

- The Paint Unpainted  mode paints only empty zones. Any line or filled zone will remain unchanged.

- The Repaint  mode paints everything it touches except empty zones. Any zone that is not painted will remain intact.

- The Unpaint  mode unpaints everything it touches, including empty and filled zones.

3. In the Colour view, select a colour.

4. In the Drawing or Camera view, start painting. Click on a zone or pencil line to paint it, or trace a lasso or marquee selection to paint several zones or pencil lines at the same time.

NOTE: The last colour you select while using the Paint tool will be used the next time you select the Paint tool if you're using the unlocked painting tools in the Colour view.

Repainting

You can use the Paint tool to click on the zones to repaint. If you click in an empty zone, it will fill the area.

You can repaint lines, zones, and brush strokes using the Repaint tool. The repaint pencil lines more efficiently, see [Inking Lines on page 546](#). The Repaint tool does not fill empty zones, even if they are closed.

If you imported and vectorized drawings, during the vectorization process on traditional scanned drawings, triangles are added on the lines' intersections to break the artwork in segments. This way, when you paint a line, it will not repaint the entire drawing, only the relevant segment—see [Creating Break Triangles on page 542](#).

The Brush tool can be used to repaint specific segments. The Brush tool's Repaint Brush mode is used to paint a section by manually painting over the lines. This is useful when the vectorization triangles are not placed as you would like or you simply need to repaint a section of a segment. It is also useful for paperless animation, where there are no triangles. So, the Repaint Brush is used to paint a certain area. It acts like the Brush tool, but will only show on painted areas that are already painted.

Unlike the Brush tool's regular mode, the Repaint Brush mode flattens automatically. The brush strokes are not added one on top of each other.

NOTE: To avoid repainting specific colours, see [Protecting Colours](#)

How to access the Repaint Tool

1. In the Tools toolbar, select the Repaint  tool. You can also find the option in the Tool Properties view when the Paint tool is selected.
2. In the Camera or Drawing view, click on the zones to repaint. You can also make a lasso or marquee selection around several zones.

How to enable the Repaint Brush mode

1. In the Tools toolbar, select the Brush  tool.
2. In the Tool Properties view, click the Repaint Brush  button.
3. In the Camera or Drawing view, draw on the zones to repaint.

Repainting a Selection

The Repaint Selection command is used to repaint any art inside a selection. You must first draw a selection using the Select tool in order for this command to be available. You can also click on the colour swatch in the colour palette to automatically repaint your selection.

The Repaint Selection On All Drawings command is used to repaint any art inside a selection on all the drawings contained within the same layer. You must enable the Permanent Selection option in the Select tool Tool Properties view and then select an area of your drawing using the Select tool in order for this command to be available. The Permanent Selection option lets you maintain the same selection throughout the drawings of a same layer.

NOTE: To avoid repainting specific colours, see [Protecting Colours](#)

How to repaint a selection

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the zones to repaint.

3. To repaint the selection on all drawings, enable the Permanent Selection  option in the Select tool Tool Properties view.
4. Do one of the following:
 - From the top menu, Camera or Drawing view menu, select **Drawing > Paint > Repaint Selection** or **Repaint Selection on All Drawings**.

Repainting Outside a Selection

The Repaint Outside Selection command is used to repaint any art outside a selection. If no selection has been drawn using the Select tool, the entire drawing will be repainted.

The Repaint Outside Selection On All Drawings command is used to repaint any art outside a selection on all the drawings contained within the same layer. You must enable the Permanent Selection option in the Select tool Tool Properties view and then select an area of your drawing using the Select tool in order for this command to be available. The Permanent Selection option lets you maintain the same selection throughout the drawings of a same layer.

NOTE: To avoid repainting specific colours, see [Protecting Colours](#)

How to repaint outside a selection

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the zones you do not want to repaint.
3. To repaint outside the selection on all drawings, enable the Permanent Selection  option in the Select tool Tool Properties view.
4. Do one of the following:

- From the top menu, Camera or Drawing view menu, select **Drawing > Paint > Repaint Outside Selection** or **Repaint Outside Selection on All Drawings**.

Unpainting a Selection

The Unpaint Selection command is used to unpaint any art existing inside a selection. You must first draw a selection using the Select tool in order for this command to be available.

The Unpaint Selection on All Drawings command is used to unpaint all art contained inside a selection on all the drawings within the same layer.

You must enable the Permanent Selection option in the Select tool Tool Properties view and then select an area of your drawing using the Select tool in order for this command to be available. The Permanent Selection option lets you maintain the same selection throughout the drawings of a same layer.

How to unpaint a selection

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the zones to unpaint.
3. To unpaint the selection on all drawings, enable the Permanent Selection  option in the Select tool Tool Properties view.
4. Do one of the following:
 - From the top menu, Camera or Drawing view menu, select **Drawing > Paint > Unpaint Selection** or **Unpaint Selection on All Drawings**.

Unpainting Outside a Selection

The Unpaint Outside Selection command is used to unpaint any art existing outside a selection. If no selection have been drawn using the Select tool, the entire drawing will be unpainted.

The Unpaint Outside Selection on All Drawings command is used to unpaint all art outside a selection on all the drawings within the same layer. You must enable the Permanent Selection option in the Select tool Tool Properties view and then select an area of your drawing using the Select tool in order for this command to be available. The Permanent Selection option lets you maintain the same selection throughout the drawings of a same layer.

How to unpaint outside a selection

1. In the Tools toolbar, select the Select tool.
2. In the Camera or Drawing view, select the zones you don't want to unpaint.
3. To unpaint the selection on all drawings, enable the Permanent Selection  option in the Select tool Tool Properties view.
4. Do one of the following:
 - From the top menu, Camera or Drawing view menu, select **Drawing > Paint > Unpaint Selection** or **Unpaint Selection on All Drawings**.

Selecting Strokes with the Current Colour

You can select zones painted with a specific colour swatch.

How to select the zones painted with the current colour

1. In the Colour view, select the colour from which you want to select the corresponding zones.

2. Do one of the following:
 - Select **Drawing > Select Strokes With Current Colour**.
 - Press **Ctrl + Shift + A** (Windows/Linux) or **⌘ + Shift + A** (Mac OS X).

Creating Break Triangles

The Brush tool is often the most intuitive and rapid tool for creating rough sketches and clean lines. A single colour, such as black, is often used when tracing a clean version of a rough sketch. However, when it comes time to soft trace the lines in different colours, the flattened or unflattened clean brush strokes can suddenly become time consuming to ink.

Toon Boom Harmony lets you create triangular breaks at line intersections. These intersections are the probable locations where colour line breaks naturally occur, such as where a sleeve meets a hand.

How to create breaking triangles on a drawing

1. In the Drawing or Camera view, use the Select  tool to select part or all of the drawing to be broken.

2. Select **Drawing > Create Breaking Triangles**. If your brush strokes are not flattened, they will be flattened automatically before the breaking occurs.

3. Use the Repaint tool  to paint the outline of different colour zones with different colours.

Closing Gaps

T-HFND-004-014

When painting, you may notice that some drawing areas are not closed. To close the zone, you can draw the missing line with the Brush or Pencil tool, or close the gap with an invisible line using the Close Gap tool.

The Close Gap tool lets you close small gaps in a drawing by creating small, invisible strokes between the two closest points to close the colour zone. You do not need to trace directly over the gap. You can draw it a few millimeters away. The two closest points automatically close the gap.

How to close gaps

1. Select **View > Show > Show Strokes** or press K to see a preview of the result.
2. In the Tools toolbar, select the Close Gaps  tool.
3. In the Camera or Drawing view, trace a line near the gap to be closed. Your strokes will be invisible.
4. Enable the Auto-Flatten  option in the Tool Properties view if you want your strokes to be flattened with your artwork. They will cut overlapping drawing strokes in two pieces.

The gap automatically closes.

Picking a Colour with the Dropper Tool

While working in the Camera or Drawing view, you can use the Dropper tool to pick a colour from your drawing without going to the Colour view.

NOTE: To learn more about the Dropper tool options, see the Reference guide .

How to use the Dropper tool

1. Do one of the following:
 - In the Tools toolbar, select the Dropper  tool.
 - From the top menu, select **Drawing > Drawing Tools > Dropper**.
 - Press Alt + D.
2. In the Camera or Drawing view, click on the desired colour.
 - If you're using another drawing tool such as the Paint tool, you can temporarily hold down the D key and click in your drawing before releasing the key to pick your colour. When you release the key, you will return to your previous tool. You may also want to select the zones painted with the colour currently selected in the Colour view. This can be useful for removing rough lines from a clean drawing.

Inking Lines

T-HFND-004-012

Although pencil lines can be painted in much the same way as closed zones, you can use the Paint, Repaint, Repaint Brush, and Ink tools to make painting segmented lines easier. Normally when you have a drawing, such as the one below, and you use the Paint tool to paint one of the lines, the entire line is painted.

However, if you select the Ink tool instead and click on the same pencil line, only the segment that you clicked on between two intersections will be painted.

Painting and inking can be used in combination depending on what you need to paint. If you need to ink a character's outline in black, it might be easier to use the Paint tool. If you need to paint the outline of a character's neck with a tan colour and its shirt outline blue and both the neck and shirt belong to the same continuous outline, then the Ink tool might prove more useful.

NOTE: Unless you are repainting all the lines in an entire animation sequence, do not use the Apply Tool to All Drawings option. Since the line positions change a lot over time, you risk painting lines that should not be painted.

NOTE: To avoid repainting specific colours, see [Protecting Colours](#)

NOTE: To learn more about the Ink tool options, see the Reference guide .

How to use the Ink tool

1. In the Tools toolbar, select the Ink  tool located in the Paint tool drop-down menu.

2. In the Drawing or Camera view, click on the pencil lines to repaint.

- The newly inked segment is always moved on top of all other pencil strokes, even if it was behind all other pencil strokes before it was inked. To reverse that behaviour, disable the Raise  option in the Tool Properties view.

- Hold down Alt while clicking a segment to do the opposite option from the Raise mode current state. The inked segment will be sent to the back or forward, even if it was in front or behind all other segments to begin with.

Verifying Painted Zones

When the ink and paint process is completed, it's always a good idea to verify that every zone was painted properly.

The first step to check your ink and paint is to go through all your drawings and verify that there are no colour mistakes. You can use the F and G keyboard shortcuts or the Preview option available in the Xsheet.

The backlight produces a silhouette effect by changing the drawing's coloured areas into a single dark, solid colour. Use this to verify the completeness of the ink and paint process. Any unpainted zones can be seen as the light shows through the unpainted areas of the silhouetted drawing.

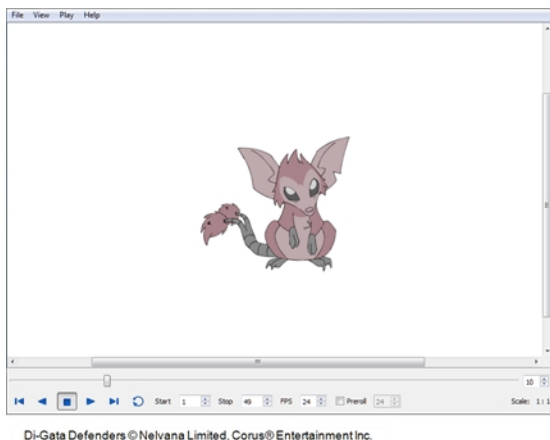

How to preview drawings from the Xsheet

1. First, save your scene.
2. Do one of the following:
 - From the top menu, select **File> Save**.
 - Click the Save  button.
 - Press Ctrl + S (Windows/Linux) or ⌘ + S (Mac OS X).
3. In the Xsheet view, select the range of drawings or the whole column to preview.

- In the Xsheet View menu, select **View > Preview Selected Drawings** or press Alt + P.

The Play window opens.

- Play your drawings.

- Select the **Preroll** option to see blank frames at the beginning and end of the animation sequence while looping the playback.

How to use the backlight

NOTE: This feature is only available in the Drawing view.

- Do one of the following:
 - From the top menu, select **View > Backlight**.
 - Press Alt + Shift + B.
- Verify the drawings in the Colour Art to make sure that all the areas are painted. From the Camera or Drawing View menu, select **View > Switch to Colour Art** or press L.
- In the Art Layer toolbar, click the Preview All Art Layers  button to see the colour zones with lines to ensure that you did not forget any spots between the colour filling and lines.

About the Edit Gradient and Texture Tool

T-HFND-006-019

If you paint a zone with a gradient or texture colour, you can use the Edit Gradient/Texture tool to modify its position in the zone. You can move, scale, rotate and skew. If you want to match the colour to the animation, set the first texture position and copy the Edit Gradient/Texture position. When moving to the next drawing, you can select the next texture and paste the previous position to continue the modifications.

If you are painting a hand-drawn animation or if you want the Brush and Paint tool to use your gradient's position, angle and scale settings instead of the default ones, you can store your own settings and reuse them afterward.

This way of editing a texture using the Edit Gradient/Texture tool also works with pencil lines drawn with textured "brushes". If you then paint your textured pencil line with a gradient, you can do so and then edit both elements independently at the same time.

How to use Pencil Editor tool to edit the texture or gradient on a pencil line

1. Do one of the following:
 - In the Tools toolbar, select the Pencil Editor  tool.
2. Click on the pencil line to be modified to bring up its contour envelope.

3. Select one of the contour points around the envelope and move its position to change the size of the tiled texture or gradient. You can also pull directly on the lines of the contour envelope or play with the Bezier handles

of any given point in order to continue to modify the envelope form.

Expanding the width of the envelope parallel to the pencil line's central vector will cause the tiled texture to be stretched. Conversely, reducing the envelope's width will cause the tiled texture to look squashed. Reducing the contour's width perpendicular to the pencil line's central vector will reduce the number of tiles, while expanding it will increase the number of tiled images.

This editing technique does not just work on texture fills, but can also be applied to pencil lines drawn with a textured "brush".

How to use Edit Gradient/Texture tool to edit the texture or gradient on a pencil line

1. Do one of the following:
 - ▶ In the Tools toolbar, select the Edit Gradient/Texture  tool.
 - ▶ From the top menu, select **Drawing > Drawing Tools > Edit Gradient/Texture**.
 - ▶ Press Shift + F3.
2. Click on the pencil line to be modified to bring up the editor controls.

- The editor controls delineate a single tile in the texture. For gradients, this is less applicable. Pull on the top of the editor controls to stretch the tiled texture throughout the length of the stroke.

As gradients are parallel to the stroke's central vector, this will stretch the way that the gradient is distributed in the pencil line's envelope. The envelope still acts as a boundary for the texture or gradient.

- Drag the editor control perpendicular to the stroke. You will feel it glide along the stroke's central vector line. This is another way to resize the texture tile. Instead of stretching or shrinking it vertically, this motion stretches or shrinks it vertically. As gradients are parallel to the pencil line's central vector, stretching them vertically gives no visual result.

How to use Edit Gradient/Texture tool to edit the texture and gradient of a pencil line

- Do one of the following:
 - ▶ In the Tools toolbar, select the Edit Gradient/Texture  tool.
 - ▶ From the top menu, select **Drawing > Drawing Tools > Edit Gradient/Texture**.
 - ▶ Press Shift + F3.
- Click on the pencil line to be modified to bring up the editor controls.

3. Use the top editor controls edit the gradient.

4. Use the bottom controls edit the “brush” texture.

Using the Edit Gradient and Texture Tool

T-HFND-006-019A

You can use the Edit Gradient/Texture tool to reposition a texture or gradient within a painted zone.

How to use Edit Gradient/Texture tool

1. Do one of the following:
 - In the Tools toolbar, click the Edit Texture  tool.
 - From the Camera or Drawing View menu, select **Drawing Tools > Edit Gradient/Texture**.
 - Press Shift + F3.
2. Click the gradient or texture colour to modify.

Erik, Di-Gata Defenders © Nelvana Limited,
Corus® Entertainment Inc.

A blue selection frame surrounds the selected gradient or texture.

Erik, Di-Gata Defenders © Nelvana Limited,
Corus® Entertainment Inc.

Erik, Di-Gata Defenders © Nelvana Limited,
Corus® Entertainment Inc.

3. Edit the gradient or texture by adjusting the control handles around the selection frame.

Storing the Gradient and Texture Settings

You can store the position, scale, and angle of a given gradient or texture painted zone to reuse on other ones as you paint them.

How to store gradient and texture settings

1. In the Tools toolbar, select the Select  tool or press Alt + S.
2. In the Camera or Drawing view, select the gradient or texture zone to store.

3. In the Tool Properties view, click the Store Colour Gradient  button.

Using the Stored Gradient and Texture Settings

You can use the gradient and texture settings previously stored to paint zones using those exact parameters.

How to use the stored gradient and texture settings

1. In the Tools toolbar, select the Brush  or Paint  tool.
2. In the Tool Properties view, click the Use Stored Colour Gradient  button.
3. In the Camera or Drawing view, draw and paint.

Chapter 8: Rigging

Harmony is a great tool for building characters. You can use different techniques and features to break down your puppets.

This chapter will guide you through all the steps to create a complete simple rig. Harmony allows you to create very advanced puppets using deformations, hierarchies and z ordering. As you practice and get familiar with those concepts, you will be able to develop more complex rigs and combine various advanced features.

For more great options and features to create powerful rigs, refer to [Deformation](#) on page 633.

Chapter 8: About Rig Types

T-RIG-001-001

A rig is the process in which you will take apart the multiple pieces of your character and then reattach them together to get them to move individually. Harmony provides you with a multitude of tools to help you build characters. From the simplest of rigs, to a fully rotating character. There are about as many ways to rig a character as there are individuals who make them. The complexity of the rig is often determined by the level of animation to be achieved.

About Simple Rigs

T-RIG-001-002

Simple rigging is very fast and easy to do. It is built as follows:

- All the body parts are independent
- All the timeline layers are attached to a master peg layer (trajectory layer)

The advantage of using this technique is that you are free to move any part around without being influenced by a parent layer.

However, since the parts are not parented to each other, the parts will move from point A to point B along a straight trajectory. The hand will not follow the arm's rotation. You will have to set more keyframes for the hand to move along a curved path.

About Drawing Hierarchy Rigs

T-RIG-001-003

When you want one part to follow another part, such as the forearm following the arm, you can attach the layers one to the other. For example, you can attach the forearm layer to the arm layer without having to encapsulate the forearm into the arm layer. They will still be parented, but you can access the forearm directly without having to enter the arm layer.

The advantage of parenting layers is that the child layers will follow the parent smoothly without having to select them or create a series of keyframes.

The disadvantage of parenting layers is that you are not able to move the parent independently of its children, since the child layers receive all the transformation information from their parent.

Parenting layers, such as the arms and legs, and allowing the torso and hips to be independent from them is often a good solution.

NOTE:

To attach one layer to another, you must drag the desired layer onto the other one in the Timeline view.

Harmony offers powerful techniques to create hierarchies between your layers without having to encapsulate layers into each other. These techniques are a great improvement over the less efficient and time consuming method of creating parenting between your layers by inserting symbols into other symbols. Therefore, rigging with symbols inside symbols is **NOT** recommended.

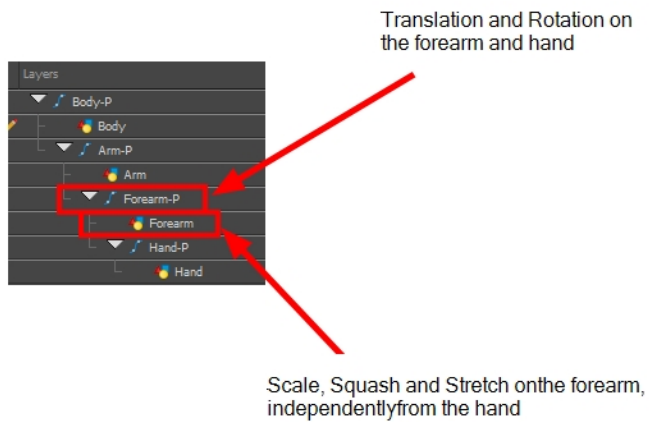

About Peg Hierarchy Rigs

T-RIG-001-004

Peg layers are useful when you are doing more advanced puppet rigging. Peg layers are trajectory layers that do not contain drawings. They are motion paths that you can use to control your entire puppet or advanced hierarchies.

Parenting a drawing layer to a peg layer allows you to divide your motions on two separate levels. You can scale a body part up the chain of pegs directly on the drawing layer. This way, you do not affect any child layers that could be attached to that part.

Then, you can perform your translation and rotation on the peg layer so all the parts attached to that peg layer follow the same trajectory.

About Scene Setup for Rigging

Planning your rig is an essential step in avoiding missteps at later stages. Once a rig has moved on to the animation level, it becomes more difficult to fix potential blunders, since updating the rig scene doesn't have repercussions on rigs outside of that scene. These different topics will help you avoid such mistakes.

About Models

To begin breaking down your puppet, you must first import your character into a new project. You can also draw your character directly in the scene.

You can import your character in several different formats:

- Library template—see [Library](#)
- Bitmap image or picture
- External vector format

Model Alignment

When setting the character model in your scene, we recommend that you to center it in the Camera view and scale it to fit inside the safe area frame.

If you have several views of your character, place each view in a separate cell and center them one on top of another. This will facilitate the break down process and ensure that all of your puppets are aligned and the same size.

Photo Puppets

If you are creating a cut-out puppet out of photos, break down the different parts in a bitmap editing software. Then, import your parts and vectorize them as textured images.

A good way to set and import your bitmap parts is to organize them in a multilayered PSD file.

In Adobe Photoshop, organize your file so that all your layers are “grouped” into individual folders, or that all the elements you want to import as a single layer in Harmony are grouped together in their own folder. Any layer that is not in a folder group, by itself or otherwise, will not be imported.

About Size Relation

Understanding the relative size of every character and prop is important for maintaining consistency and structure throughout your project.

A production may contain many characters and props. It is not unusual for these to have been created by different people. If there is no size control implemented, the characters and elements created by different artists can vary greatly in size. When this occurs, the characters that are put together in a scene will be out of proportion. The animator or person doing the scene setup will then have to scale them to the correct size.

When a character or a prop is scaled down, the outline will get increasingly thinner. By the time the element is scaled to its proper size, the outline may be so thin that the difference between one character's outline and another's will not look very good.

Line Up

A line up consists of copying and pasting all of your character designs into the same drawing and then scaling them so they are in proportion with each other. This line up is very important and should be handed to any animator, layout and posing artist, or scene setup person working on the project.

For the prop design, it is recommended that you paste one of the main character's hands or even the full body beside the prop. This enables the animator to know what size to draw or set the prop.

In your character design scene, it is a good idea to create a layer for the character line up. The line up is usually done during the character design step. When the character builder imports the model to the break down scene, the size relation should be correct.

Field Chart

The field chart in Harmony is a tool that is very useful when setting the height of characters and props. You can display the field chart using the Show Grid option in the Camera and Drawing views.

How to display the field chart

1. Do one of the following:
 - ▶ From the top menu, select **View > Grid > Show Grid**.
 - ▶ Press **Ctrl + '** (Windows/Linux) or **⌘ + '** (Mac OS X).
 - ▶ Click the Show Grid **#** button in the Camera View and Drawing View toolbars.

Brush Size

There are a variety of pens and brushes in Harmony and you can also create and save your own. It is a good idea to create and save pens with precise sizes and parameters to trace and design your models and break downs—see [About the Brush Tool on page 115](#).

Setting Preferences for Rigging

Before you start adding layers to your puppets, make sure the Default Separate Position for Elements and the Default Separate Position for Pegs preferences are enabled.

With the Default Separate Position preferences selected, when you create new layers, their X, Y and Z axes are independent from each other.

By default, the Default Separate Position for Elements preference is enabled. For cut-out animation, you want to have three independent axes so you can control them individually.

When you lock the three positions together, each time you add a keyframe, it is added on all three positions at the same time.

When you separate the three positions and add a keyframe on one axis, it is not added on the other two. This gives you more freedom when animating with motion keyframes and nudging parts forward and backward over time.

How to set the Default Separate Position options

1. Do one of the following:
 - Windows/Linux: Select **Edit > Preferences**.
 - Mac OS X: Select **Harmony Advanced > Preferences**.
 - Press **Ctrl + U** (Windows/Linux) or **⌘ + U** (Mac OS X).
2. In the Preferences dialog box, select the **General** tab.
3. In the Settings section, select the **Default Separate Position for Elements** and the **Default Separate Position for Pegs** options.
4. Click **OK**.

About Naming Conventions

When working on a production, it is critical to keep work well organized with a naming convention chart before starting the project. When dealing with thousands of characters, pieces and puppets, it is easy to get lost. Proper naming of both drawing layers and drawing substitutions is essential to keeping your workflow consistent throughout your project.

Naming Drawing Layers

It is highly recommended that you incorporate a naming convention for the layers. This will be very convenient in later steps.

One common practice is to add one or two letters for the character/prop name, so that we don't make it too long. You can then add the name of the part that you've separated. It is recommended to add an indicator of the position of your character's symmetrical pieces to keep track of which part you are selecting. Common practice is to add either "F" or "B" (for front and back view) or "R" or "L" (for right or left). Avoid using spaces in between the words and opt for an underscore instead.

- Character Orcus's right arm =

OR_arm_F

or

OR_arm_R.

Pink: Front or Right

Blue: Back or Left

In the event that you've forgotten to add a prefix or suffix to your character's drawing layers, you can add them after your layers have been created.

How to add a prefix or suffix to a series of layers

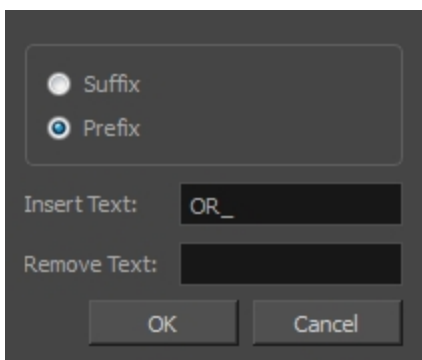

1. In the Timeline view, select all the layers to rename or press Ctrl + A (Windows/Linux) or ⌘ + A (Mac OS X).

- In the Scripting toolbar, click the Add Prefix or Suffix Script  button. If the Scripting toolbar is not visible, you can display it by selecting **Windows > Toolbars > Scripting** from the top menu. If the Add Prefix or Suffix Script  button is not visible in the Scripting toolbar.

The Add Prefix or Suffix dialog box opens.

- Select the **Prefix** or **Suffix** option depending on what you want to add to the layers' name.
- Type the prefix or suffix information to be added to the layer's name.

- Click **OK**.
- The defined prefix or suffix is added to the selected layers.

How to remove a prefix of suffix to a series of layers

- In the Timeline view, select all the layers to rename or press Ctrl + A (Windows/Linux) or ⌘ + A (Mac OS X).

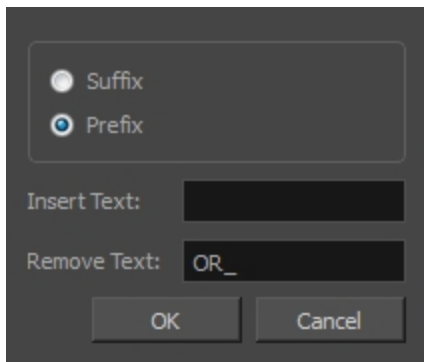

- In the Scripting toolbar, click the Add Prefix or Suffix Script  button. If the Scripting toolbar is not visible, you can display it by selecting **Windows > Toolbars > Scripting** from the top menu. If the Add Prefix or Suffix Script  button is not visible in the Scripting toolbar, see the Scripting guide

The Add Prefix or Suffix dialog box opens.

- Select the **Prefix** or **Suffix** option depending on what you want remove from the layers' name.

4. Type the prefix or suffix information to be deleted from the layer's name.

5. Click **OK**.
6. The defined prefix or suffix is removed from the selected layers.

Naming Drawings Substitutions

We recommend that you use a naming convention for your drawings. Especially if you combine all the angles of a character in the same breakdown scene, it is a good idea to identify each angle used.

	ab_arm_l	ab_hand_l	ab_head		
1	f1	f1	f1		
2	f2	f2	f2		
3	f3	f3	f3	Front angle drawings	
4	f4	f4	f4		
5	q1	q1	q1		
6	q2	q2	q2		
7	q3	q3	q3		
8	q4	q4	q4		
9	s1	s1	s1	Side angle drawings	
10	s2	s2	s2		
11	qb1	qb1	qb1		
12	qb2	qb2	qb2		
13	b1	b1	b1	Back angle drawings	
14	b2	b2	b2		
15					
16					

Before breaking down the characters for your production, we recommend that you create a drawing name convention that represents the angle used. For example, use "f" for front, "s" for side, "q" for three-quarter so that the drawing name looks like this: f1, f2, f3, s1, s2, etc. This will be quite useful during animation and drawing substitution. Since drawings are displayed in alphabetical and numerical order, all the drawings for the front view will be together, then all the drawings for the three quarter view, and so on.

Keep in mind that in the drawing substitution library, drawings will show in alphabetical order. If you want them positioned in a certain order, make sure you name them accordingly.

How to add a prefix to one or more drawings

1. In the Timeline view, select the drawing range to rename.

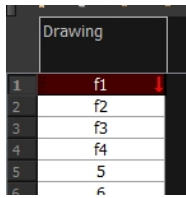

2. Do one of the following:
 - ▶ Right-click on the selection and select **Drawings > Rename Drawing with Prefix**.
 - ▶ From the top menu, select **Drawing > Rename Drawing with Prefix**.

The Rename Drawing with Prefix dialog box opens.

3. Type the characters you want to add before the current drawing name.
4. Click **OK**.

A screenshot of a software interface showing a table with a header 'Drawing' and six rows. The first row is highlighted in red and contains the text 'f1'. The other rows contain 'f2', 'f3', 'f4', '5', and '6' respectively.

Drawing	
1	f1
2	f2
3	f3
4	f4
5	5
6	6

NOTE: To rename a drawing, select the drawing and use the Rename Drawing option. Ctrl + D (Windows/Linux) or ⌘ + D (Mac OS X). or . **Do not double-click on the frame** and write a new name, as this will create a new drawing and hide your actual one. Note that the hidden drawing has not been deleted and is still located within the element folder. Simply retype the name and it will reappear.

About Character Breakdown

T-RIG-001-006

Now that you have imported or designed your model, the next step is to analyze it. This is to determine what parts will be broken apart and how they will be divided. Will the hair be separated into one, two or three sections? Will the hand be separated from the sleeve? To determine what is best for your character, observe the model in the Camera or Drawing view.

Eyelids and Pupils

For increased flexibility when animating the eyes, you can split them into three layers: the eyeball, the pupil and the eyelid. The eyelid layer is used for the blink and to cut the pupil when it gets too close to the side of the eyeball. For a more advanced break down, the two eyes are separated on their own individual three-layer sets.

Separating the Mouth Elements and Jaw

To get a greater level of flexibility, you can separate the jaw from the head. You can also separate the mouth shape, teeth, tongue and interior one from another.

Keeping Fingers Attached to the Hand

To avoid needlessly complicating the break down, the fingers are not usually separated from the hand. The full hand is a single layer with a bank of different hands stored inside. This technique is easy to work with and produces a less mechanical effect.

Flipping Logos

You can separate logos and letters that appear on a character or a prop. This allows you to flip and reuse a character's puppet.

Complete and Overlapping Pieces

For a better result with animated parts, it is important to understand that they must be properly overlapping and complete. A common mistake is to trace the part just as it appears on the model.

Head and Neck Pieces with Overlap

Normal Position

Head Tilt with Overlap

Head Tilt without Overlap

Tracing the Model

The main breakdown technique shown here is to trace your model.

How to break down a character by tracing

1. In the Timeline view, add a new drawing layer for each body part to separate. You can press Ctrl + R (Windows/Linux) or ⌘ + R (Mac OS X)—see .

2. In the Timeline view, select the layer's first cell in which you want to draw the part.

3. In the Tools toolbar, select a drawing tool.
4. In the Colour view, select a colour swatch. If you haven't created a palette for your character yet, see .
5. In the Camera or Drawing view, draw the new part with as with as few points as possible so the pieces are easy to manipulation, modify or redraw. There exists two easy ways to do this:
 - By using the Polyline  tool
 - By drawing with the Pencil  tool, then smoothing your lines with the Smooth Editor  tool

If you are working in the Drawing view, click the Light Table  button in the Drawing View toolbar to display the other layers in washed out colours. You can also press Shift + L.

6. If you want to close a shape without drawing an actual stroke, you can use the Stroke tool in the Tools toolbar to create an invisible hairline .

- Select **View > Show > Show Strokes** or press K to display the invisible lines.

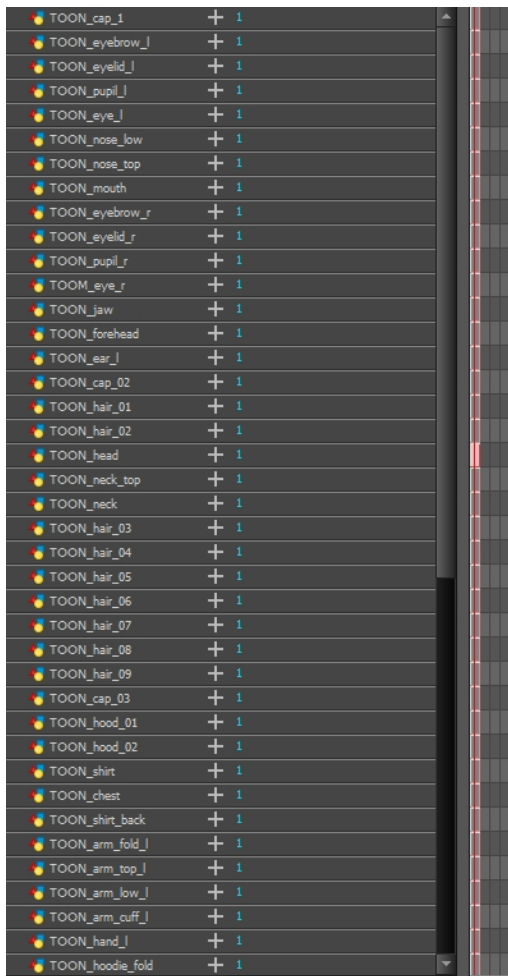

7. In the Tools toolbar, select the Paint  or Paint Unpainted  tool to colour your drawing.
8. In the Colour view, create the desired fill colour if it's not already in your palette, then select it.
9. In the Camera or Drawing view, paint your drawing.

10. In the Tools toolbar, select the Select  tool. Select your drawing and flatten the lines by clicking the Flatten  button in the Tool Properties view.
11. If your lines are composed of several pencil strokes, you might want to combine them into one single smooth pencil line. Using the Select tool, select the pencil lines to be merged and in the Tool Properties view, click the Merge Pencil Lines  button.

12. Repeat the entire process for every body part that you wish to make animatable.

About Cutting the Character into Pieces

If you do not want to redraw all the artwork for your character, you can use the cut away technique where, with the Cutter tool, you select and send pieces of the model on a new layer.

The first step in breaking down your character is to do a rough cut down of the main parts, such as the body, arms, legs and head. Using the Create Drawing from Drawing Selection feature lets you automatically create layers and copy your selection in it.

Breaking Down the Main Parts

To break down the main body parts, you will use the Create Drawing From Drawing Selection feature.

Breaks a character into its main body parts. There is no need to create any layers prior to this process. Make sure your model is well centered and sized in the Camera view.

You do not need to make clean cuts around your parts; a rough one is sufficient as long as it includes all the artwork of the part you want to break down. You will clean the extra bits and pieces later.

Using the Cutter tool, you can roughly cut the main sections, and then use the Select tool to select precise lines and colour zones.

How to break down the main parts

1. In the Timeline view, select the cell of the model that corresponds to the first view to break down.

2. In the Tools toolbar, select the Cutter  tool.
 - If you prefer to use the Select tool, choose the Select  tool from the Tools toolbar or press Alt + S.
 - In the Tool Properties view, you can switch to the Lasso  selection mode.
3. In the Camera view, create a selection around the first part to break down. If you click on a zone, the Cutter tool will select the zone. It will end the selection at the first point of intersection that it meets.

- ▶ Hold down Shift to create a new lasso selection around another zone and add it to your previous selection.

- From the top menu, select **Edit > Create Drawing From Drawing Selection** or press F9 (Windows/Linux) or $\text{⌘} + \text{F9}$ (Mac OS X).

The Create Drawing From Drawing Selection dialog box opens.

- In the Layer Name field, type the name of the layer you want to create following the naming convention you established previously.
- Deselect the **Cut Artwork From Source** option to keep the selected artwork on your original drawing. You do not want to cut the artwork from the colour model.
- Click **OK**.

The new layer is created and your selection is copied in it. The drawing is created in the same frame number as the cell it was taken from.

- Repeat the previous steps for each main body part.

Breaking Down Secondary Parts

You should now have a layer for each main part of the character for the first view to break down. You are now ready to break down those main pieces into smaller ones.

Breaking down the secondary parts is similar to the main part break down process except that this time you will cut away the artwork from the layer it has been selected from.

How to break down the secondary parts

1. In the Timeline view, lock your model layer by clicking its Lock  button.

2. In the Timeline view, select the cell that corresponds to the main part you want to break down.

3. In the Tools toolbar, select the Cutter  tool.
 - ▶ If you prefer to use the Select tool, choose the Select  tool from the Tools toolbar or press Alt + S.
4. In the Camera view, create a selection around the part to break down.

- ▶ If you click on a zone, the Cutter  tool will select the zone and end the selection at the first point of intersection that it meets. Click on the line with the Cutter tool to select it up to the next intersection.

5. From the top menu, select **Edit > Create Drawing From Drawing Selection** or press F9 (Windows/Linux) or $\text{⌘} + \text{F9}$ (Mac OS X).

The Create Drawing From Drawing Selection dialog box opens.

6. In the Layer Name field, type the name of the layer you want to create following the naming convention you established previously.
7. Select the **Cut Artwork From Source** option to remove the selected artwork from your original drawing. In this case, you want to cut the artwork from the colour model.
8. Click **OK**.

The new layer is created and your selection is copied in it. The drawing is created in the same frame number as the cell it was taken from.

9. Repeat the previous steps for each body part.

NOTE:

If you forgot to add some artwork to a layer you previously created, you can always add it later.

In the Camera view, select the artwork to send to the existing layer. Open the Create Drawing from Drawing Selection dialog box by pressing F9 (Windows/Linux) or $\text{Command} + \text{F9}$ (Mac OS X). In the dialog box, select an existing layer from the list instead of typing a new name. Click **OK** to add the artwork to the existing drawing in the layer you selected.

Breaking Down Other Views

If your character model has more than one view, now is the time to break them down.

The process is very similar to breaking down the first view. You have two choices:

- Breaking down the new view in a new set of layers
- Breaking down the new views in the same existing layers
If your layers are not in the correct order, you can reorder them later. Simply add the part that you are breaking down to the layer you previously created for the same body part.

Start by breaking down the main pieces, as you did before. The secondary parts will be broken down later on.

Repeat the following steps for each extra view you need to break down.

How to break down the other views

1. In the Timeline view, selected the model's cell corresponding to the view to break down. Don't forget to unlock the layer.

2. In the Tools toolbar, select the Cutter  tool.
 - If you prefer to use the Select tool, in the Tools toolbar select the Select  tool or press Alt + S.
2. In the Camera view, create a selection around the first part to break down.

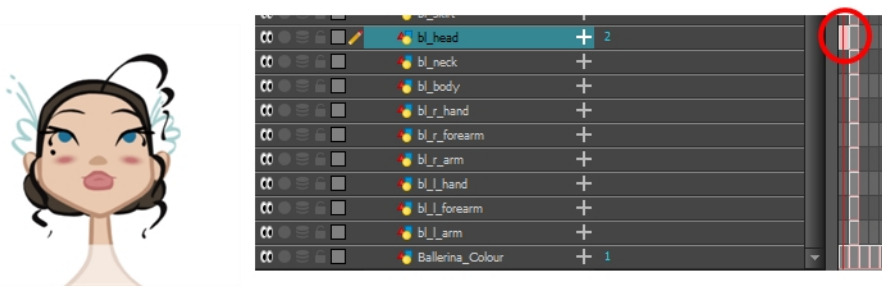

3. From the top menu, select **Edit > Create Drawing From Drawing Selection** or press F9 (Windows/Linux) or ⌘ + F9 (Mac OS X).

The Create Drawing From Drawing Selection dialog box opens.

4. In the Layer Name field, select the corresponding layer from the list if you want to use the same layers or type a new name if you want to create a new layer.
5. Deselect the **Cut Artwork From Source** option to keep the selected artwork on your original drawing. You do not want to cut the artwork from the colour model.
6. Click **OK**.

The artwork is inserted into the existing layer. The drawing is created in the same frame number as the cell it was taken from. It is not incorporated in the other view's drawings.

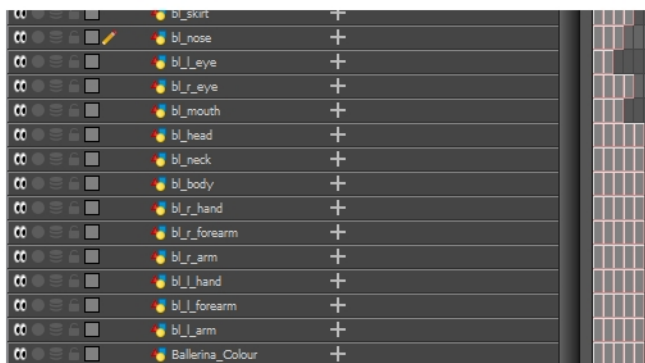

7. Repeat step 1 to 7 for each main body part.

Breaking Down Secondary Parts in the Extra Views

To break down the secondary parts for your extra views, follow the exact same process as you did for the first view you broke down, but you will incorporate the new parts in the existing layers—see [Breaking Down Other Views on page 590](#).

Each view can have its own set of layers in the Timeline view, therefore each view does not necessarily need to have the same layer structure.

Here is an example of how your timeline should look at this stage:

Completing Parts and Articulations

Now that all the layers are created and the parts are basically broken down, it is time to clean up the parts and complete the articulation.

Cleaning the Parts

You will need to use a series of drawing tools to clean the parts:

-  Brush tool
-  Eraser tool
-  Select tool
-  Cutter tool
-  Contour Editor tool
-  Paint tool
-  Close Gap tool

How to clean your drawings

1. In the Tools toolbar, select the drawing tool you need to fix your drawings.

2. In the Timeline view, select the cell containing the drawing to fix.
3. In the Camera view, delete the extra bits using the Select  or Cutter  tool. You can also use the Eraser  tool.

4. Draw the missing lines using the Brush  tool. If you use the Brush tool, it is recommended that you enable the Auto-Flatten  option in the Tool Properties view.

- Using the Paint  tool, paint the gaps. You can close some gaps with invisible lines using the Close Gap  tool or press Alt + C.

- Reshape your lines using the Contour Editor  tool or press Alt + Q.

- Using the Select  tool, select the entire drawing and click the Flatten  button in the Tool Properties view to flatten your drawings.
- From the top menu, select **View > Show > Show Strokes** to display the invisible lines that could be present in your drawing or press K.

- From the top menu, select **Drawing > Optimize > Remove Extra Strokes** to remove any unnecessary invisible lines in the drawing.
- Repeat this entire process for each drawing to fix.

Distributing to Layers

When breaking down a character, you can distribute each selected art stroke to a new layer.

Each stroke you select in the Camera view is automatically placed on a new layer. One layer per stroke.

If one part of your puppet is composed of several strokes, you must group them before distributing them onto new layers.

NOTE: You cannot distribute layers in the Drawing view; it must be done in the Camera view.

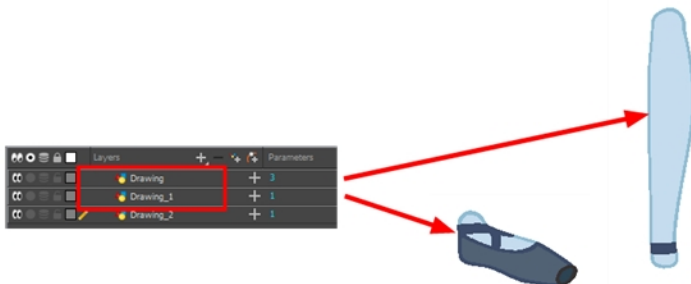

How to distribute to layers

1. In the Tools toolbar, click the Select  tool.
2. In the Camera view, select the art strokes you want to distribute to different layers.

3. From the top menu, select **Drawing > Distribute to Layers** or click the Distribute to Layers  button in the Tool Properties view.

Drawing layers are created in the Timeline view, each corresponding to the different strokes or groups of strokes selected. Each stroke or group of strokes is distributed into each new Drawing layer. The selected strokes in the original drawing layer are removed.

About Articulations

Once your pieces are traced, you can go ahead and complete the articulations.

Articulations are an important aspect of any cut-out break down because without them, a puppet cannot move properly and will not look good.

If you are using deformations to animate the limbs, your articulations don't need to overlap. The deformer effect will create the joint for you.

Creating Classical Articulations

Classical articulation is the most popular technique for basic characters. It is quite simple and produces excellent results, but it's not the most efficient method. In many instances, it causes limitations and extra drawing corrections. For example, there may be a gap in the articulation if the part is bent too far. Joint design is usually a circle; the overlapping part cannot be sent behind without showing the joint.

Classical articulation is done by erasing a part of the line from the overlay layer, leaving the colour overlapping the bottom layer. You can use this technique for all the articulations on your puppet.

How to create a classical articulation

1. In the Timeline view, select the cell containing the part to modify (piece located behind), such as the upper arm.

2. In the Tools toolbar, select the Pencil , Polyline , Ellipse , Cutter , or Contour Editor  tool.
3. In the Colour view, select an outline colour.
4. In the Drawing or Camera view, use your drawing tool to make sure the joint overlaps the other part in a half-circle shape.

If you are working in the Drawing view, click the Light Table  button in the Drawing toolbar or press Shift + L.

5. From the top menu, select **View > Show > Show Strokes** or press K to display the invisible lines that may be present in your drawing.
6. In the Drawing or Camera view, select all the strokes in your drawing.
7. In the Tools Properties view, click the Flatten  button.
8. In the Drawing or Camera view, select all the strokes in your drawing.
9. In the top menu, select **Drawing > Optimize > Remove Extra Strokes** to remove any unnecessary, invisible lines in your drawing.
10. Repeat the previous steps for the other articulations.
11. In the Timeline view, select the cell of the part that will be on top of the joint.

NOTE: When placing rotation pivots later on, make sure they are positioned at the centre of the articulation.

About Ordering Layers

T-HFND-005-005

At this point, it is possible that your character's pieces may show up in the wrong order.

There are several ways to fix this. First, you can reorder your layers by dragging them to a higher or lower level in the Timeline view. The top layer is displayed in front of the others and the bottom one is displayed behind. Second, you can use the Z-axis nudging (forward and backward) if you have extra views included in the same layers (front, three-quarter, back, etc.).

Ordering Layers in the Timeline View

T-HFND-005-006

In the Timeline view, the layer positioned at the top will be displayed in front and the ones below will be displayed behind. If you have multiple views, you should order your layers based on the most common view, which is generally the three-quarter front.

How to order layers

1. In the Timeline view, drag a layer to reorder it and drop it between other layers.

If you drop it on a layer, it will create a parent hierarchy, so make sure to drop it between layers.

About Z Nudging

T-HFND-005-008

If you created a hierarchy on your arms, legs or other body parts, it is possible that you will want a part, such as the hand, to appear in front of its parent. Yet, if you move the hand layer above the arm layer, you will break the hierarchy. To reorder a layer rigged in a hierarchy, nudge it backwards or forwards on the z-axis.

NOTE: You will do the same for the layers that are not in the right order on the extra views. Do not place the drawing on another layer. You want to keep all your drawings of the body parts in the same layers like a box containing all of the hands or all of the shoes.

Harmony allows you to move your elements in three dimensions:

- Up and down (Y-axis)
- Left and right (X-axis)
- Backwards and forwards (Z-axis)

Nudging Layers

T-HFND-005-009

In the same way you create multiplane backgrounds (depth), you can perform a micro nudge of the part to be reordered and see it in front of the other elements, even if its layer is actually behind the other ones in the Timeline view. The forward-backward position can also be animated over time.

How to nudge layers backwards and forwards

1. In the Tools toolbar, select the Transform  tool. Make sure to enable the Animate  mode.
2. In the Camera view, select the element you want to reorder. Make sure the focus (red outline) is around the Camera view before selecting the element.
3. To move the element forward, press Alt + Up Arrow and to move the element backward, press Alt + Down Arrow.

About Pivots

T-RIG-006-001

Even with a complex hierarchy, a rig is useless without positioning the proper pivot points. This will allow the puppet's pieces to rotate correctly. The arm needs to rotate from the shoulder and stay attached to the torso, so its pivot point needs to be positioned accordingly. A good way to achieve this is to position the pivot point exactly in the center of the articulation.

The initial position of the pivot point is always at the center of the scene. Sometimes there will not be an obvious place of rotation to place the pivot point, but it's a good idea to reposition the pivot to the best transformation point. For instance, the master peg, which generally controls the entire rig, is often best positioned between the character's feet.

About Permanent Pivots

T-RIG-006-002

This is a permanent pivot, sometime referred to as peg pivot, that is applied to the entire drawing or peg layer. If you modify its position, it will be changed for the entire layer, modifying the animation, scale and rotation interpolation. The permanent pivot is set using the Rotate, Translate or Scale tool. The Transform tool will only move that pivot temporarily for positioning purposes, but the animation interpolation will be done from the original permanent pivot's position. The Transform tool is designed to move the pivot temporarily during the animation process. It also permits you to select multiple pegs and apply a common temporary pivot.

To permanently move a peg pivot, use the Rotate or Scale tool. You can also directly type the values in the Layer Properties window in the Pivot section's (x) Axis and (y) Axis fields.

In the Layer Properties window, in the Drawing Pivot section, select the **Don't Use Embedded Pivot** option to use the permanent pivot.

For a simple character rig, it is recommended to set the Peg pivot (even on drawing layers) using the Rotate  tool.

Setting Permanent Pivots

T-RIG-006-004

In this section, we'll take a look at one of the options we have for setting pivots. The permanent pivot allows you to push your rigs to great lengths without having to worry about repositioning your pivot once it is set.

How to set the pivots with the Rotate tool

1. In the Advanced Animation toolbar, select the Rotate  tool.
2. In the Camera or Timeline view, select the layer whose pivot you want to set. In the Camera view, you can also hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click on the piece whose pivot you want to set.
3. In the Camera view, drag the blue pivot to reposition it.

4. Repeat the previous steps for all the pieces, including the eyes, nose and mouth. If you are unsure as where to place the pivot, put it in the center of the selected piece or group of pieces.

NOTE: If you added other pegs to your rig, you must set their pivot using the same method.

Setting Multiple Permanent Pivots

You can simultaneously set the position of pivots for several drawing layers or pegs that you would like to rotate and scale from the same point of origin,

How to set pivots on multiple pegs

1. Select the multiple pegs or drawing layers from either the node view or timeline view.
2. Select any Advanced Animation tool, such as the  Rotate tool.
3. Reposition your pivot using the Advanced Animation tool

NOTE: Never use the Transform tool to permanently position pivots. The Transform tool only temporarily repositions it to accommodate your transformation, usually during the animation process.

About Drawing Pivots

T-RIG-006-003

The Drawing pivot is contained within each drawing. In one layer, each drawing can have its own pivot. If you have many different views of a character within one layer, the pivot positions can be different and the animation will adjust to the pivot. The Drawing pivot can also be referred to as *embedded pivot*. If you are not mixing different views within the same layers or are using pegs to animate your layers, it is recommended to use the permanent pivot.

You can set a different pivot for each one of your drawings. For example, if you have a series of drawings from different views, they are not likely to rotate from the same location. In that case, you can set a different pivot for these drawings by using the Drawing Pivot  tool.

In the Layer Properties window, in the Drawing Pivot section, select the **Apply Embedded Pivot on Drawing Layer** option to use the drawing pivot directly on the drawing layer. If you want to apply the drawing pivot to a parent peg to force the peg to follow the drawing pivot variations, enable the **Apply Embedded Pivot on Parent Peg** option.

Setting Multiple Drawing Pivots

If you are using the drawing pivots rather than the Rotate tool pivot and if some elements need the same drawing pivot, such as all of the three-quarter hands, you can select all of these hands cells and set the pivot all at once. If your pivot is already correctly set on your first drawing, copy and paste that pivot onto the other drawings in the Timeline or Xsheet view.

You must have the same drawing pivots on the extra parts from the same angle. If you substitute a drawing while the part is rotating, the animation risks popping out of place if the pivot is uneven.

How set the drawing pivot of a frame range

1. In the Drawing or Camera view, set the first drawing pivot of the series. For example, set it on hand-1.

2. In the Timeline view, select the cell that contains the correct pivot.

3. From the top menu, select **Edit > Copy**.
4. In the Timeline view, select the cell range that requires the same pivot.

- From the top menu, select **Edit > Paste Special** or press **Ctrl + B** (Windows/Linux) or **⌘ + B** (Mac OS X).

The Paste Special dialog box opens.

- In the Paste Special dialog box, select the **Advanced** tab.
- In the Drawings section, select the **Update Drawing Pivot** option.
- Click **OK**.

NOTE: You can also copy and paste the pivot from one drawing to another using the keyboard shortcuts **Ctrl + C** and **Ctrl + V** (Windows/Linux) or **⌘ + C** and **⌘ + V** (Mac OS X) when the drawing pivot tool is active and the focus is around the Camera view.

About Symbol Pivot

The Symbol pivot is similar to the Drawing pivot. Each symbol cell can have its own pivot and act the same as the Drawing pivot. The Symbol pivot can also be referred to as *embedded pivot*. Inside a symbol, each drawing can have its own pivot. If you are not mixing different views within the same layers or are using pegs to animate your layers, it is recommended to use the Peg pivot.

Setting Symbol Pivots

If you want the puppet's pieces to rotate correctly, you must set the pivot points onto the articulations. You can set the pivots using the Rotate tool which sets it for the entire layer or you can set the pivots directly on your symbol and have a different pivot for each symbol cell. By default, when you create symbols, the symbol pivot is located at the centre of your drawing. You will need to move it onto the shoulder or elbow.

You will set the pivot on the symbol's cells, not directly on the drawings. To set your pivots, you must be at the top level of your character building scene and not inside the symbols.

By default, when you set the pivot onto a symbol, all the cells use the same pivot. If you need different pivots for different cells, refer to the following procedure.

Do the following steps for each layer in the Timeline view.

How to set the pivots on a symbol

1. In the Tools toolbar, select the Drawing Pivot  tool or select **Drawing > Tools > Drawing Pivot**.
2. In the Camera or Timeline view, select the symbol on which you want to set a pivot.

3. If you only want to set one pivot for your symbol, in the Tool Properties view, select the Set the Pivot for Symbol on All Frames  button.

- Deselect this button if you want to set a series of different pivots for your symbol's cells.
4. In the Camera view, click where you want the pivot to be. You can also drag the pivot marker to the desired location.

5. If you want to set a different pivot for another drawing or symbol cell, select the drawing or cell and in the Camera view, set the new pivot. Make sure the Set the Pivot for Symbol on All Frames button is deselected.

Adding Pegs

Pegs are a special type of layer that do not contain any drawing. They are used strictly to offset and transform drawings that are under their hierarchy, without transforming the actual drawing.

When rigging or setting up a scene, it is recommended to add parent pegs for each of your drawing layers. This allows you to keep animation keyframes and drawings on separate layers, making it easier to work on the position and exposure of your drawing layers independently in the Timeline view. It also makes it easier to create a hierarchy of which body parts can be animated together and independently.

If you want to animate only on pegs, you can activate the Peg selection mode of the Transform tool in the Tool Properties view. You can also disable animating drawing layers, so that only pegs can be animated.

NOTE: It is also possible to make drawing layers the children of other drawing layers. Just like the way animating a peg animates its children layers, animating a drawing layer with children will also animate its children layers.

How to create parent pegs for your layers in the timeline

1. In the Timeline view, select all the layers.

2. In the Timeline Layer toolbar, click the Add Parent Peg  button to add a parent peg to all selected layers.

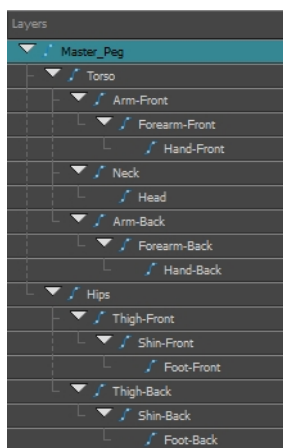

S

Creating Hierarchies

Harmony lets you build your rig in an elaborate hierarchy, allowing you to set which parts of your rig should influence other limbs, and how they can move independently. For example, when rigging a simple character's arm, you can make the forearm layer a child of the arm layer, and the hand layer a child of the forearm layer. This way, if the character moves their forearm, the hand will follow, and if they move their arm, the forearm and hand will follow.

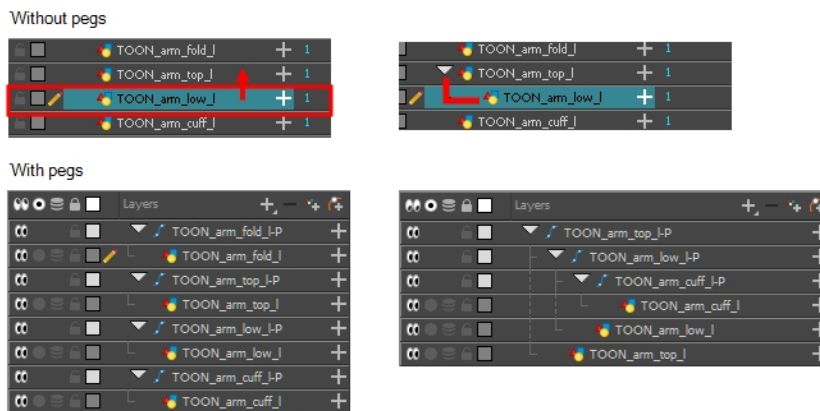

When building a basic character rig, you should at least have a hierarchy for each arm and each leg. You can make a hierarchy going from the torso, the neck and the head, and rig the arms to the torso, and you can rig the legs to the hips. This would make a hierarchy like this:

How to create a hierarchy in the Timeline view

1. In the left area of the Timeline view, select the layer which you want to make a child layer
2. Drag the child and drop it over the layer which you want to make the parent layer. Make sure you are not dropping the child layer between two layers.

- Repeat until you've created a hierarchy that rigs all of your character's parts, with a master peg at the root. While rigging, if you want several layers to have a common parent, but no existing part of your rig can serve as that parent, create a new peg and nest those layers under that peg.

NOTE: In the Timeline view, you can unparent layers by holding down Shift and dragging the selected parents away from the child layer. Drop your selected between other layers.

When rigging, keep in mind that the order of the layers in the Timeline view affects the order in which they're rendered. Layers on top of the list will be rendered over layers at the bottom of the list. Should you need to change a layer's order while animating, you can nudge this layer's position on the Z-axis to override the layer order and force it to appear beneath or over other layers.

How to nudge a layer on the Z-axis

- In the Tools toolbar, select the Transform  tool.
- In the Timeline, Node or Camera view, select the layer you want to nudge.
- If you selected the layer from the Timeline or Node view, click on the Camera view tab to set the focus on the Camera view.
- Do one of the following:
 - To nudge the layer forward, press Alt + Down Arrow.
 - To nudge the layer backward, press Alt + Up Arrow.

Adding the Master Peg

Your character rig should always have a master peg which connects to all of its parts. The master peg allows you to manipulate the entire rig from a single layer, without having to manipulate each individual part. This is useful for positioning and scaling your character relative to the scene, as well as to animate your character's trajectory when it has to move between areas of the scene.

How to add a master peg in the Timeline view

1. In the Timeline view, select the top layer.
2. In the Timeline view, click on the Add Peg  button.
A new peg is added to the timeline as a parent of the selected layer.
3. Name the new peg **Master** plus the character's name.
4. In the Timeline view, select all the layers you want to attach to your new peg. Remember that one item is already parented to that peg.
5. Drag your selection **ON** to the peg layer to parent all your character's pieces to the peg. If your layers are added above the already parented layers, move that parented layer back on top of the layer stack.

Invert-Cutting

When rigging a character, there may be instances when you want to have the ability to move a particular piece to give the illusion of a rotation or move the pupil within the white of an eye without having the extra bit of the drawing sticking out of the character or eyeball. To do so, you can use masks to cut anything you don't want to be visible.

How to mask an object in the Timeline view

1. In the Timeline view, make sure the keyframe is added on the object that will be masking the piece to cut.

2. Select the layer that will act as the mask.
3. In the Timeline view, right-click on the layer and select **Clone Selected Layers: Drawings and Timing**.

4. Select the layer to be masked.
5. In the Layer toolbar, click the Add Layer button and select **Effects > Cutter**.

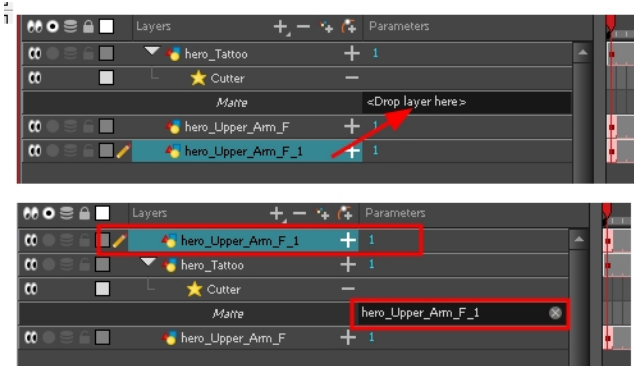

6. Click the Expand Parameters **+** button to display the Cutter properties.

7. Drag the cloned layer **ONTO** the Matte parameter connection area.

The masking layer name appears in the Matte parameter area and the masking layer is repositioned above the effect.

The masking layer is no longer visible in the Camera view. You can see that the masking layer is connected to the Cutter effect by clicking the Show/Hide Additional Links → button to display the Additional Links section.

8. Your masking effect is most likely inverted and what you want to cut is probably showing. Double-click on the Mask layer to open the Layer Properties window. In the Layer Properties window, enable the **Inverted** option.

9. In the Tools toolbar, select the Transform  tool and move the cut object within the masking zone.

Grouping Rigs

Once your rigging is completed, you must group the puppet's skeleton to help organize the often large and complex networks. This way, once you have imported two or three characters into the scene, three Group nodes will be displayed instead of all the rigging connections of three puppets.

How to group nodes

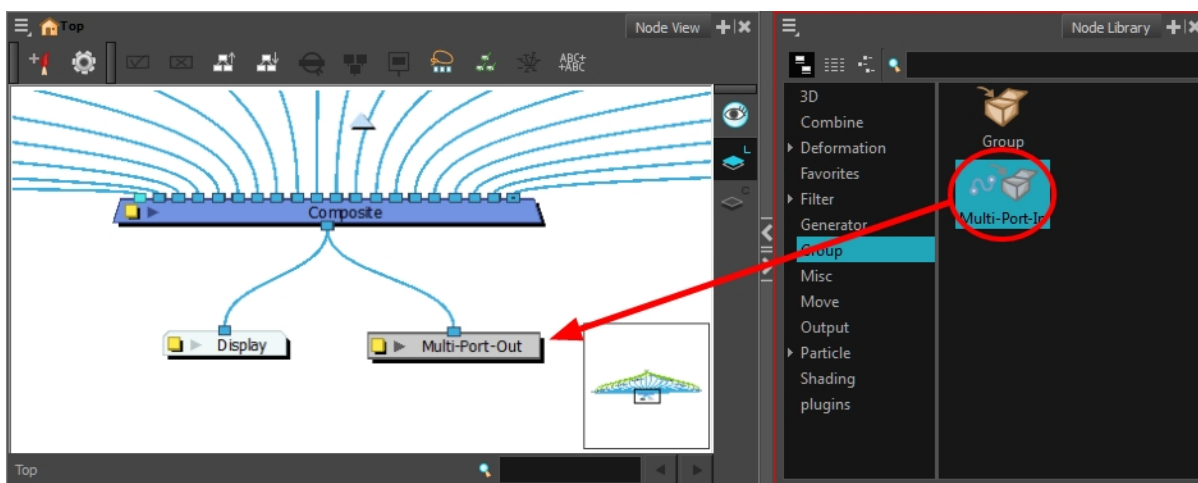

1. In the Node view, select all your nodes.
2. In the top menu, select **Edit > Group > Group Selected Layers** or press Ctrl + G (Windows/Linux) or ⌘ + G (Mac OS X).

Your nodes are grouped.

3. Click on the Group node's right arrow to enter the group.

4. If you do not have a Multi-Port Out node inside your group, in the Node Library view, select the **Group** category and select a **Multi-Port Out** node.

5. Drag the Multi-Port-Out node to the Node view.
6. Connect the Composite node's output port into the Multi-Port Out node.
An output port is created on your Group node.
7. In the bottom-left corner of the Node view, click **Top** to return to the network's root. You should now see an output port on your Group node.

8. Click on the Group's Properties button to open the Layer Properties window.

9. In the Layer Properties window, rename the Group node with your character's name.
10. Click **Close**.

Creating Keyframes

Once all your drawings are ordered and your master peg is added, you need to insert keyframes on each cell to create all of the function curves and block your pose in place.

How to create the keyframes

1. In the Timeline view, collapse the master peg by clicking the Expand  arrow.

2. In the Timeline view, select the first cell.

3. Do one of the following:
 - From the top menu, select **Insert > Keyframe**.
 - In the Timeline View toolbar, click the Add Keyframe  button.
 - Press F6.

NOTE: If you use the F6 shortcut when working Flash keyboard shortcuts flavour, this not only creates a keyframe but also duplicates a drawing.

About Timeline Marking

As you animate, the Timeline view will accumulate many layers and keyframes. You might want to identify them using coloured layers and scene markers.

Scene markers are visual indicators displayed at the top of the Timeline view in the frame counter area. You can use it to denote anything relevant to your work. You can indicate the frames you want to clean up, a change in action, an impact, or where you intend to apply an effect. You can also add a note to a scene marker, which is displayed when you hover over the scene marker.

There are two ways to add a scene marker. You can mark the current frame or make a frame range selection and mark the whole section.

To see how to mark the Timeline, see [Marking the Current Frame](#), [Marking Frame Ranges](#), [Marking Layers with Colour](#)

About Pose Copier

The pose copier is a scrip that can be added to your Scripting toolbar. The goal of the Pose Copier is to facilitate the reuse of poses from a master template by taking information from it and pasting it at the desired frame. It does not create new information outside of what is contained in the template.

In order for the Pose Copier to work, templates need to be set up properly to maximize the compatibility of the script. It is recommended to keep only the frames that will be needed. Empty or unused frames may appear within the sliders.

For a simple use of the script, create a template of the part that you wish to use with the pose copier. It could be the entire character, the head, the lip sync or any other part. It is recommended to template groups as opposed to scattered individual nodes. To maximize compatibility, keep the hierarchy of your template identical to the hierarchy of your rig.

You can also create an advanced setup to select specific frames using guide layers—see [About Guide Layers on page 626](#).

NOTE: To learn more about the Pose Copier dialog box, see the Reference guide

Adding the Pose Copier Script to the Scripting Toolbar

To use the Pose Copier, you need to add the script to the Scripting toolbar.

How to add the Pose Copier script to your Scripting toolbar

1. Select **Windows > Toolbars > Scripting** to display the Scripting toolbar.
2. In the Scripting toolbar, press the Manage Scripts  button to open the Scripts Manager.
3. In the Files section, select the **TB_Pose_Copier.js** script file.
4. In the Functions section, select **TB_Pose_Copier** function.
5. Press the Add Script to Toolbar  button to send it to the Scripting toolbar.
6. Press OK to close the Script Manager.

About Guide Layers

The guide layers are ordinary drawing layers named in a way that will associate them with the 3 sliders of the pose copier. These layers will need to be incorporated inside the template for the sliders to work when activating the pose copier script.

You need to create three drawing layers for the three sliders to work. These will need to be named accordingly including a dash character. Suffixes may be added after the dash for additional information as seen in the example above.

- **slv-** for the vertical layer that will be used for the tilt
- **slh-** for the horizontal layer which will be used for the turn
- **slx-** for the second horizontal layer that will be used for the lipsync

In those guide layers, you will need to create empty drawing cells. These frames will represent the different slider positions to which you will have access in the pose copier. The guide layer frames need to match the character's frames if they are to show an accurate view of the information that will be pasted.

In the example above, the slh (horizontal) slider contains 5 frames. The horizontal sliders are read in alphabetical order from left to right. You can add numbers to display them in the desired order.

- 1front
- 2quarter-front
- 3side
- 4quarter-back
- 5back

The slv (vertical) slider contains 3 frames. The vertical slider works in alphabetical order from the way down and moving up, hence the numerical prefix.

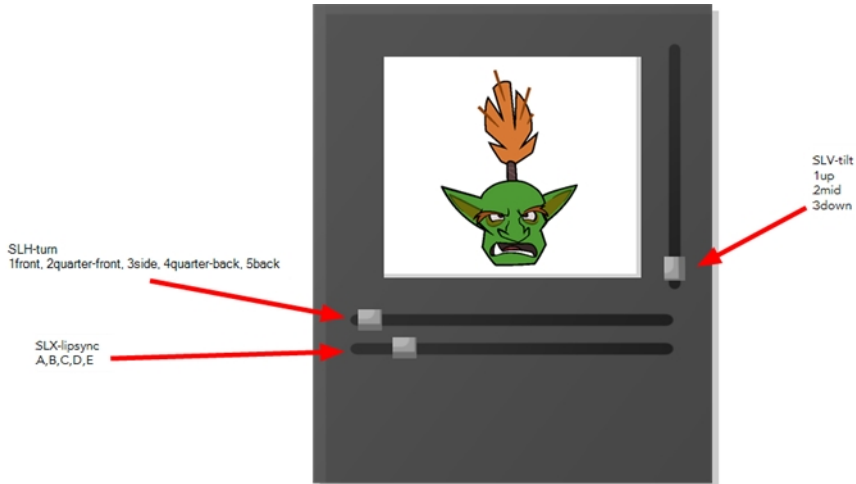

- 1down
- 2mid
- 3up

The slx (expression) slider contains 5 frames. Each of these frames holds different combinations which will be used for the different sliders to access the frames of the template.

- A
- B
- C

- D
- E

For example, setting the slh (horizontal) slider to 1front, the slv (vertical) slider to 3down and the slx (expression) slider to B will display a front pose, looking down, using the B mouth.

NOTE: To learn more about the Pose Copier dialog box, see the Reference guide

Creating a Pose Copier Template

The pose copier template is a regular template of assets that will be used to copy and paste information from the template over to a scene. Guide layers may be used inside of the pose copier template as additional efficiency tools for selecting your pose.

How to create a Pose Copier template

1. In the Node view or in the leftmost section of the Timeline view, select the nodes intended to make the template.
If you have created guide layer nodes, make sure to include them in the selection as well.
2. Copy the selection using one of the following:
 - ▶ Press **Ctrl + C (Windows/Linux)** or **⌘ + C (Mac OS X)**.
 - ▶ From the top menu, select **Edit > Copy**.
3. In the Library view, select a folder to store the template.
4. If a library folder is locked, right-click and select **Right to Modify**.
5. With the folder selected, paste the selection into the folder using one of the following:
 - ▶ Press **Ctrl + V (Windows/Linux)** or **⌘ + V (Mac OS X)**.
 - ▶ From the top menu, select **Edit > Paste**.
6. In the Rename dialog box, give the new template a name.
To rename a template once it is created, right-click on the symbol and select **Rename**.
7. Click **OK**.
8. Right-click on the template and select **Generate Thumbnails**.

You will see a preview of your template in the Drawing Substitution area of your Library view. The thumbnails are the images used inside the Pose Copier, therefore it is essential to do this before using the Pose Copier the script. Once this step is completed, the thumbnails are stored within the template. You will not need to do this again unless you recreate your template.

Excluding Modules Using the Pose Copier

Inside the Pose Copier Script dialogue box, there is a button on the upper right corner called "Exclude Modules". On the immediate left of the button is a check box to enable or disable the option to excluded the nodes that have been added to the exclusion process.

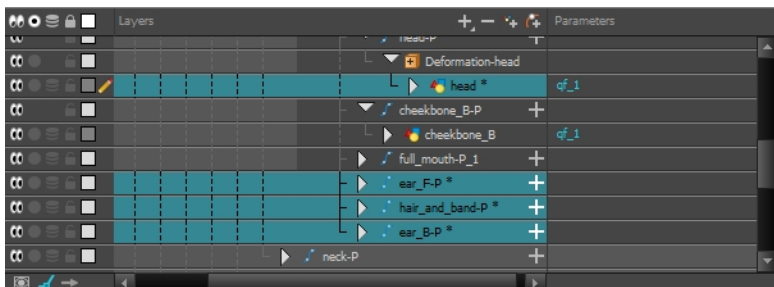

How to create a node exclusion preset.

1. From the pose copier dialogue box, click on the Exclude Modules button.

The Exclude Modules List dialogue box opens.

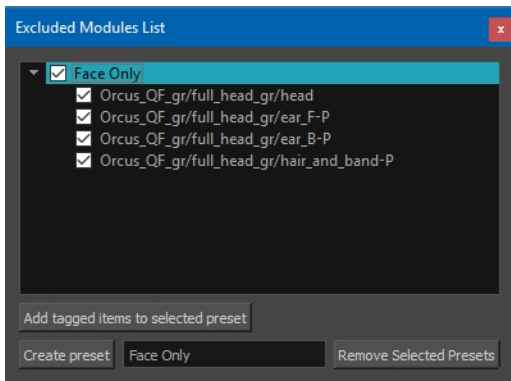

2. From the timeline view select the elements that you wish to exclude from the pose copier template.
3. Right click on the selected modules and select **Tag > Timeline Tag**.

The selected modules are tagged and an asterix * appears next to the tagged modules.

4. In the dialogue box of the excluded modules list, enter a name for the preset that will be created.
 5. Click the Create preset button.
- A new preset is created.
6. To add the tagged nodes to the preset, select the preset and click the Add tagged items to the selected preset button.

The tagged modules are added to the preset.

How to exclude modules using the pose copier

1. Press the Excluded Modules button to launch the Excluded Modules List dialogue box.

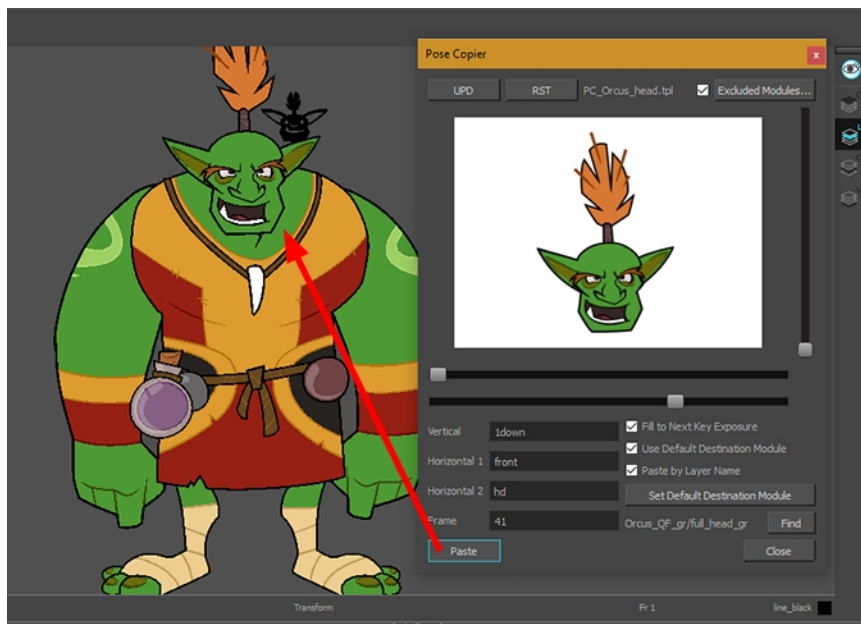

2. From the Excluded Modules List dialogue box, keep the presets that you wish to exclude checked while unchecking the ones you wish to include.
3. Close the Excluded Modules List dialogue box.
4. Check the box to the left of the Excluded Modules button to enable the option.

5. Proceed with pasting keys from the template.
The excluded modules are no longer affected by the pasting options.

Pasting Poses Using the Pose Copier

Once the templates have been created and set up properly, it is easy to paste a variety of poses from one or multiple templates onto a still character awaiting posing.

Depending on how the template has been set up, a different destination has to be set up in order for the pasting to take place.

How to Set the Default Destination with the Pose Copier script.

1. In the Library view, select the template you want to copy poses from.
2. If it was not done previously, right-click on the template and select **Generate Thumbnails**.
The thumbnails are generated and showing in the Drawing Substitution View.
3. With the template still selected, run the **TB_Pose_Copier** script by clicking on it in the Scripting toolbar—see [Adding the Pose Copier Script to the Scripting Toolbar on page 625](#).
The Pose Copier dialog box opens.
4. From the timeline, select the destination of the pasted keyframes by selecting the node or topmost node of your hierarchy for the selected template.
5. With the destination highlighted in the timeline, (see below table for setting the proper destination) press the **Set Default Destination Module** button from the Pose Copier dialog box.

Once selected, this information will remain saved within the template.

Selecting the Destination Layer		
Type of template	Paste by Layer Name Option	Default Destination
Grouped Nodes	Enabled	Set it on the same group as the templated group or any node above it in the hierarchy. If a node inside that group is selected, pasting

		will not take place.
	Disabled	Select the same group as the one templated.
Nodes	Enabled	Select any node in the hierarchy as the default position.
	Disabled	Unless you've only templated a single node, it is preferable to turn on the Paste By Layer Name option.

How to Paste Poses With the Pose Copier Script

1. Do one of the following:
 - Set Default Destination to the designated layer and enable the Use Default Destination Module option.
 - Manually select the layer for the destination of the pasting.
2. Select a pose using the different sliders—see [About Guide Layers on page 626](#).
3. Click Paste to apply it on your character at the currently selected frame.

Chapter 9: Deformation

T-RIG-007-001

Deformations let you animate bitmap or vector-based graphics, including gradients and textures. Deformations act as a skeleton with limbs and articulations you can bend, reshape, and curve. You can deform a character made out of one, or many, drawing or image layers and make it move as if it were a cut-out puppet.

A deformation skeleton is composed of deformation nodes, which are the various pieces (here represented as layers or nodes) required to articulate or deform your drawings, such as a series of bones or game bones.

About Deformer Types

The 4 types of deformer are: Bone, Game Bone, Curve and Envelope. Each type has its own advantages and limitations and need to be rigged and handled in different ways.

About Bone Deformation

T-RIG-007-002

The Bone deformation allows you to create a bone-like structure in which each part is solid, but with articulations that are flexible. This is mostly useful for animating a character's limbs, such as the arms or legs, or other parts that can be articulated such as torsos or fingers. For example, a Bone deformation can be used to articulate an arm that is made of a single drawing, so that the upper arm and forearm can be moved independently, without having to draw the upper arm and the forearm on different layers. Harmony will deform the drawing to make it look articulated. The different parts of a Bone deformation can be rotated around their joint, extended and shortened, giving you the same capabilities as animating articulations on different layers, without having to worry about parts detaching, pivot points, or clipping outlines.

About Game Bone Deformation

T-RIG-007-003

The Game Bone deformation is very similar to the Bone deformation. It allows you to create a bone-like structure in which each part is solid, but with articulations that are flexible. This is mostly useful for animating a character's limbs, such as the arms or legs, or other parts that can be articulated such as torsos or fingers. For example, a Game Bone deformation can be used to articulate an arm that is made of a single drawing, so that the upper arm and forearm can be moved independently, without having to draw the upper arm and the forearm on different layers. Harmony will deform the drawing to make it look articulated. The different parts of a Game Bone deformation can be rotated around their joint, extended and shortened, giving you the same capabilities as animating articulations on different layers, without having to worry about parts detaching, pivot points, or clipping outlines.

The Game Bone deformation is different from the Bone deformation in which it is optimized for game engines such as Unity. Hence, it is usually only used for game development and not in animated productions. The difference between the Bone and Game Bone deformations is that Game Bone deformations do not have a Bias property. The articulation folds also look slightly more rounded.

About Basic Deformation Chain Creation

Using the Rigging tool, you can quickly create a basic deformation rig.

As you create your chains, the controls will be showing. However, whenever you close your project, the deformation controls display is turned off. When you reopen the project, you can display all controls or only some of them—see [Displaying the Deformation Controls on page 1](#).

Setting Rest Positions for Bone and Game Bones

Every deformation rig needs to have a set resting position. The resting position is important as it acts as a 0 point for all the transformations that will be made to the drawing when animating. The resting position is also where we can see what parts of the drawing are assigned to which bone or articulation.

How to set up Bone and Game Bone deformation chains

1. In the Timeline view, select the deformation nodes you want to set.
2. In the Deformation toolbar, click the Show Selected Deformers and Hide All Others  button to display the deformer controls in the Camera view. This also hides all the deformer controls that were displayed.
3. In the Deformation toolbar, click the Rigging  tool.

The chain turns from green to red. A green chain indicates the puppet is in animation mode. A red chain indicates the puppet is in a resting position. Make sure your chain is red.

4. In the Camera view, set up the deformation chain.
 - Rotate the first bone to change the angle of the chain.

- Use the root control to reposition (offset) the entire chain.

- Use the control points to reposition the articulations. This will elongate, shorten or change the direction of the bone and offset the subsequent children.

- Use the articulation's control (square) to change the size of the articulation. For quality purposes, it is recommended to have an articulation which fits the diameter of the part it controls.

5. Repeat until all the articulations and bones of the chain are correctly aligned to the element to which it is linked. You can also set additional parameters in the Layer Properties window—see the Reference guide .
6. With the deformation nodes still selected, in the Deformation toolbar, click the Reset Current Keyframe  button. This will set the current resting position as the current frame one.
7. Use the Transform  tool. For optimal results, make sure the size of the articulation is approximately the same size as the drawing.

How to add an articulation to an existing Bone or Game Bone deformation

1. Select the drawing layer or the deformation chain to which you want to add an articulation.
2. In the Deformation toolbar, click the Show Selected Deformers and Hide All Others  button to display the deformer controls in the Camera view. This also hides all the deformer controls that were displayed.
3. Select the Rigging  tool.

The deformation chain turns from green to red. A green chain indicates that you're animating the deformation. A red chain indicates that you're modifying the rig.

4. Move your cursor over the bone segment, where you want to add an articulation.
5. Hold Alt and click.

Selecting Region of Influence Types

There are four types of region of influence:

- **Zero:** This creates no influence around the deformer.
- **Infinite:** This is the default option. The influence goes all the way to the image boundaries or until it intersects with another zone of influence. When working on a cut-out puppet built on several element layers, the best choice is to keep the default Infinite option as the zone of influence type. In the following examples, the zones of influence are explained through deformation chains on a single bitmap image. It's also recommended to keep the regions of influence to Infinite when using Envelope deformers.
- **Elliptic:** This creates a region of influence following the deformer. Its size is based on a radius value. When you set up the shape of your Elliptic zone of influence, you should be as accurate as possible and make sure that only the element you want to follow the deformation is included inside the zone.
- **Shaped:** This creates a custom region of influence around the deformer that can be adjusted using control points and Bezier handles. When you set up the boundaries of your Shaped zone of influence, you should be as accurate as possible and make sure that only the elements that you want to follow the deformation are included inside the zone.

When you have an Elliptic zone of influence selected in the Node view, you can convert it to a Shaped zone using the Convert Elliptic Zone of Influence to Shape option.

How to select a region of influence type

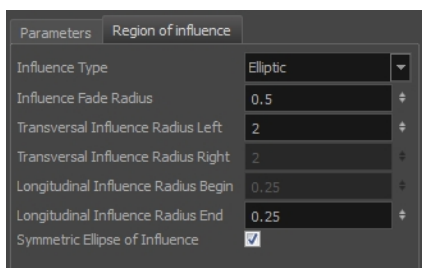

1. In the Timeline view, select the deformation nodes you want to set the region of influence for—see [Displaying the Deformation Controls on page 1](#).
2. In the Deformation toolbar, click the Show Selected Deformers and Hide All Others  button to display the deformer of the selected piece.
3. In the Layer Properties window, in the Region of Influence tab, set the Influence Type:
 - Zero
 - Infinite
 - Elliptic
 - Shaped

Setting Up Elliptic Regions of Influence

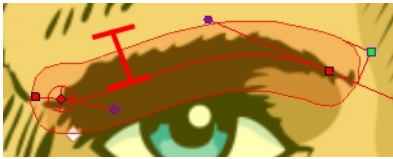

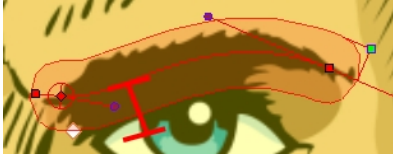

An elliptical region of influence is suited for regular shapes. Modify its parameters to refine the region boundaries.

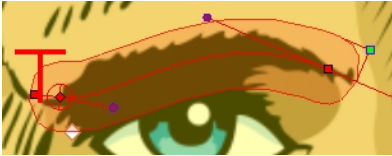

How to set up the Elliptic region of influence

1. In the Timeline view, select the deformation nodes you want to set the region of influence for—see [Displaying Deformation Controls](#).
2. In the Deformation toolbar, click the Show Selected Deformers and Hide All Others  button to display the deformer of the selected piece.
3. In the Layer Properties window, in the Region of Influence tab, set the Influence type to **Elliptic**.

4. Set up the ellipse shape by adding values to the various fields:

Influence Fade Radius	This defines the size of the fade area around the actual region of influence's boundaries.
Transversal Influence Radius Left	When the Symmetric Ellipse of Influence option is enabled, this field controls the Left and Right transversal radius values. When disabled, it controls the size of the left transversal radius. By default, this value is set to 2. 
Transversal Influence Radius Right	When the Symmetric Ellipse of Influence option is enabled, this field becomes inactive. The Left Transversal radius value is automatically applied to the Right Transversal. When the Symmetric Ellipse of Influence option is disabled, it controls the size of the Right Transversal radius. By default, this value is set to 2. 
Longitudinal Influence Radius Begin	When the Symmetric Ellipse of Influence option is enabled, this

	<p>field becomes inactive. The End Longitudinal value is automatically applied to the Begin Longitudinal value. When the Symmetric Ellipse of Influence option is disabled, it controls the size of the Begin Longitudinal radius. By default, this value is set to 0.25.</p> 
<p>Longitudinal Influence Radius End</p>	<p>When the Symmetric Ellipse of Influence option is enabled, this field controls both the Begin and End Longitudinal radius values. When this option is disabled, it controls the size of the End Longitudinal radius. By default, this value is set to 0.25.</p> 
<p>Symmetric Ellipse Influence</p>	<p>Enabled by default. The shape of the ellipse will be symmetrical on both the transversal and longitudinal radii. In this case, use the Transversal Influence Radius Left field to set the transversal radius value and use the Longitudinal Influence Radius End field to set the longitudinal radius value. The two other fields will remain unused unless you disable the Symmetric Ellipse Influence option. In that case, you can set up different radius sizes for the four radii directions.</p>

5. You can also modify the elliptic shape in the Camera view using the Rigging  tool.

- If the Symmetric Ellipse of Influence option is enabled, one control point will be available in the Camera view. Drag this point in any direction to increase or decrease the size of the Zone. Dragging it left/right will modify both longitudinal radius sizes. Dragging it up/down will modify both transversal radius sizes.

- If the Symmetric Ellipse of Influence is disabled, two control points will be available in the Camera view. Drag the top-corner point left/right to modify the end longitudinal radius size and up/down to modify the left transversal radius size. Drag the bottom-corner control point left/right to modify the beginning longitudinal radius size and up/down to modify the right transversal radius size.

Setting Up Shaped Regions of Influence

A Shaped region of influence is suited for irregular forms. Modify the region parameters to refine the shape's boundaries.

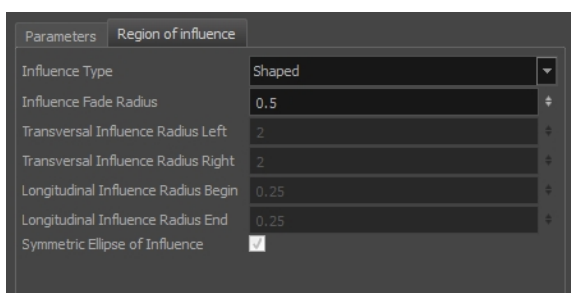

How to set up the Shaped zone of influence

1. In the Timeline view, select the deformation nodes you want to set the region of influence for—see [Displaying Deformation Controls](#).
2. In the Deformation toolbar, click the Show Selected Deformers and Hide All Others  button to display the deformer of the selected piece.

If you selected the Shaped option in the Layer Properties window or in the Rigging tool properties, the zone of influence will be square. This square has control points on all four corners and each control point as two control levers. If you converted an Elliptic zone to a shape, the zone will have more control points and handles.

3. In the Layer Properties window, in the Region of Influence tab, set the Influence type to **Shaped**.

All radius options are disabled except the Influence Fade Radius option—see [Setting Up Shaped Regions of Influence on page 645](#).

- In the Camera view, use the Rigging tool and drag a control point to redefine its position and shape.

- Click and drag the control lever handle to modify the corners and redefine the shape.

- Hold Alt down while dragging the control lever handle to move one handle at a time.

Converting Elliptic Regions of Influence into Shapes

After you have tried tweaking an elliptical region of influence, you may find that you need to convert the ellipse into a shape, in order to create a more precise region. Instead of losing all the tweaks you have made, you can use the elliptical region you have created as a base for a Shaped region of influence.

How to convert an Elliptic zone of influence to a shape

1. In the Timeline view, select the deformation nodes you want to set the region of influence for—see [Displaying Deformation Controls](#).
2. In the Deformation toolbar, click the Show Selected Deformers and Hide All Others  button to display the deformer of the selected piece.

3. In the Tools toolbar, click the Rigging  button.
4. In the Tool Properties view, in the Operations section, click the Convert Elliptic Zone of Influence to Shape  button.

The zone of influence is automatically converted to a shape. The shape is retained and control points appear around the zone, so you can customize the shape.

About Assembly

After you have created all the deformation chains for your character, you will need to assemble these separate body parts into a puppet. Your pieces should be properly overlapping and not set apart.

To avoid problems such as having the head stretched by the neck deformers or a hand modified by the body deformers, you can use the Kinematic Output node to assemble your pieces without propagating the deformations down the hierarchy chains.

The Kinematic Output node lets you hook a separate element that you want to be linked to the deformation chain but not be part of the deformation, such as a hand to an arm or an arm to the body. These elements will follow the movement of the chain just like a regular cut-out character hierarchy piece without being influenced by the deformation of the arm. If you don't use the Kinematic Output, the piece's pivot will not follow the deformation.

When building a cut-out puppet with deformations, each part controlled by a deformation chain will automatically rotate from the chain root point, which acts like a pivot. Because it is unlikely that every piece of your character will be rigged with a deformation chain, you must set pivot points for the pieces that are not using deformations—see [Setting Permanent Pivots on page 604](#).

Assembling Guidelines

When assembling a puppet with deformers, there are some guidelines to keep in mind:

- You cannot parent deformers directly because deformers are not designed to be used on other deformers. To assemble deformers, you must insert a Kinematic Output node.

- Your peg must be placed above the deformer.

Assembling in the Timeline View

In order to assemble the rigged parts of your character in the Timeline view, you need to use a Kinematic Output layer.

How to assemble a puppet using the Kinematic Output node in the Timeline view

1. Select the element to attach to the Kinematic Output node, such as the hand or head peg.

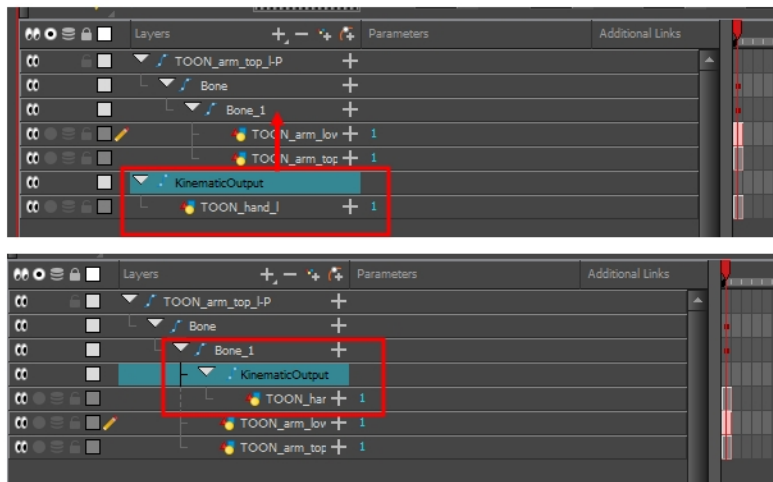

2. From the top menu, select **Insert > Kinematic Output**.

The node appears in the Timeline view as a parent of your selection.

3. In the Timeline view, drag and drop the Kinematic Output layer ONTO the deformation layer you want your limb or piece to follow. For example, onto the neck deformer if you want your head to follow it without being deformed or onto the arm deformer if you want your hand to follow.

- If your pieces are no longer ordered properly, use the Z-nudging feature to reorder them—see [About Ordering Layers](#) on page 598.

- It's good practice to rename the Kinematic Output layer to reflect which deformer it is assigned to as the Timeline view can become very large and layers can be positioned far apart. Select the Kinematic Output node and in the Layer Properties window, rename the node. You can also double-click on the layer's name.

Displaying Selected Deformation Controls

Harmony lets you control which deformers are displayed in the Camera view independently from the current selection. When you create a deformation chain, its deformation controls are displayed in the Camera view. However, if you select an existing deformer or a layer that's connected to existing deformers, its deformation controls won't display right away. Likewise, deselecting a deformation chain will not hide its deformation controls. Before you can animate or modify an existing deformation chain, you must manually display it.

How to display the selected deformation chains

1. Do one of the following:
 - In the Timeline view, select any part of the deformation chain you want to display.
 - In the Camera, Timeline view, select one of the drawing elements linked to the deformation chain you want to display.
2. In the Deformation toolbar, click the Show Selected Deformation Chain and Hide All Others  button.

The selected deformation controls appear in the Camera view and all the others are hidden.

NOTE: The Show Selected Deformation Chain and Hide All Others button will display all deformation chains that are in the hierarchy of the selection. For example, if the master peg of a character model is selected, all of its deformation chains will be displayed. Likewise, if multiple layers linked with different deformation chains are selected, all of their deformation chains will be displayed.

Hiding Deformation Controls

You can hide all the deformation controls for your rig all at once.

How to hide the deformation controls

1. Do one of the following:
 - Click in the negative space of the Camera view, Timeline view or Node view to discard the current selection, then click on the Show Selected Deformation Chain and Hide All Others  button in the Deformation toolbar.
 - Select a layer that is not linked to any deformer, then click the Show the Selected Deformation Chain and Hide All Others  button in the deformation toolbar.
 - In the Camera toolbar, click the Hide All Controls  button.
 - From the top menu, select **View > Hide All Controls**.
 - Press Shift + C.

About Deformation Animation

Just like with animating pegs and drawing layers, you can animate your deformers by creating keyframes on their corresponding layers in the Timeline. Animating deformers works exactly like making modifications to a deformer, except it requires using Transform  tool instead of the Rigging tool. When the Transform tool is selected, deformation controls in the Camera view display in green, which means they are in animation mode, whereas when the Rigging tool is selected, they display in red, meaning they are in rigging mode.

Animating Bone and Game Bone Deformers

You can add keyframes to deformers reposition their deformation controls to create animated sequences.

How to animate Bone and Game Bone deformations

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. In the Tools toolbar, enable the Animate  mode. This allows the Transform tool to affect the position and size of a layer at the current keyframe only, whereas it would otherwise affect the layer's position and size throughout the whole scene.
3. In the Timeline view, collapse your character using the Expand/Collapse arrow.

4. Select the first frame of the scene.

5. To ensure your model doesn't disappear after 1 frame, extend its exposure by right-clicking on the first frame in the Timeline and selecting **Extend Exposure** or by pressing F5. In the Set Exposure dialog, type in the amount of frames in your scene and confirm. This will make your model exposed (visible) throughout your whole scene,
6. Now, we will make your character's first pose. First, make sure there is a keyframe on the first frame of every layer of the model. This ensures that when you make the second pose later, your first pose will not be affected. To do this do one of the following:
 - In the Timeline toolbar, click the Add Keyframe  button.
 - Right-click and select **Add Keyframe**.
 - Press F6.

A keyframe is added on the current frame.

7. Do one of the following:
 - In the Timeline view, select any part of the deformation chain you want to display.
 - In the Camera, Timeline view, select one of the drawing elements linked to the deformation chain you want to display.
8. In the Deformation toolbar, click the Show Selected Deformation Chain and Hide All Others  button.
The selected deformation controls appear in the Camera view and all the others are hidden.

9. In the Camera view, do the following:

- Rotate the first bone to rotate the limb.

- Rotate the subsequent bones to bend the limb.

- Use the root control to reposition (offset) the entire chain.

- Use the control points to reposition the articulations. This will elongate, shorten, or change the direction of the bone and offset the subsequent children.

10. In the Timeline view, go the frame on which you want to set the next key pose.

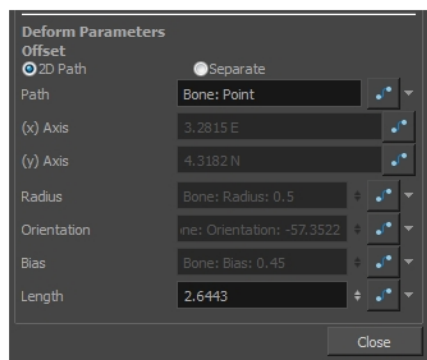

11. Add a keyframe on the current frame by doing one of the following:

- In the Timeline toolbar, click the Add Keyframe  button.
- Right-click and select **Add Keyframe**.
- Press F6.

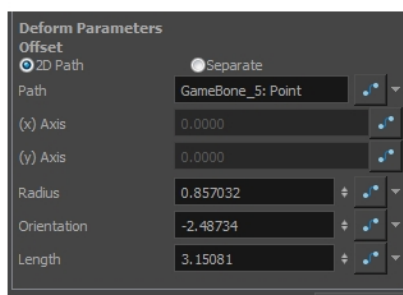

12. Repeat the previous steps to animate your character.

NOTE: When manipulating the articulation of a Bone or Game Bone deformer, you can hold the Alt key to lock the bone's angle and only shorten or elongate the bone. You can also hold the Ctrl (Windows/Linux) or ⌘ (Mac OS X) key to break the articulation off its chain and make it into a new, separate deformer chain.

NOTE: You can also manipulate the deformer by typing values directly in the Layer Properties of the deformation effect nodes.

Bone layer properties

Game Bone layer properties (no Bias)

Resetting a Deformer to its Resting Position

If you need to reset the current pose of the entire chain for the entire scene, you have the possibility to reset the deformation chain to the resting position on the current or all frames.

How to reset the position of deformers from the Camera view

1. In the Timeline view, move the playhead to the frame where you want to reset the puppet to the resting position.
2. Do one of the following:
 - In the Camera or Timeline view, select one of the drawing layers linked to the deformation chain you want to [[[Undefined variable Variables.SnippetVariable1]]].
 - In the Timeline view, select any part of the deformation chain you want to [[[Undefined variable Variables.SnippetVariable1]]].
3. In the Deformation toolbar, either:
 - Click the  Show the Selected Deformation Chain and Hide All Others button to show the selected element's deformation chain and hide any other deformation chain that is currently displayed.
 - Click the  Show Selected Deformers button to show the selected element's deformation chain along with any other deformation chain that is currently displayed.

The selected deformation controls appear in the Camera view.

4. In the Camera view, select the deformation point you want to reset. To select several deformation point, hold Ctrl and click on each point you want to reset to add them to the selection.
5. In the Deformation toolbar, click on the Reset Current Keyframe  button to reset the position of the selected chain on the current frame.

How to reset the position of deformers from the Timeline view

1. In the Timeline view, move the playhead to the frame where you want to reset the deformer to its resting position.
2. In the Timeline view, select the deformationlayer(s) you want to reset.
3. In the Deformation toolbar, click on the Reset Current Keyframe  button to reset the position of the selected chain on the current frame.

NOTE: To completely reset the position and remove all keyframes on all frames, click on the Reset All Keyframes  button.

Disabling Deformation Preview

When adding new drawings while animating, you may need to see the reference drawings as their original resting position as it may be quite difficult to draw on a deformed canvas. You have the possibility to disable deformations in Harmony so that all drawings appear in their resting position.

NOTE: Disabling deformations is only a display mode. Although drawings will not appear deformed in the Camera view, even in Render View mode, they will still be deformed in the rendered images.

How to disable the deformations to create new drawings

1. In the Deformation toolbar, click on the Enable Deformations  button to toggle deformation preview.

Transferring Curve Positions of Legacy Deformations

You can let us transfer all of the information from first curve deformer to its parent Offset node. This is useful for a legacy scene created using Curve deformations where the Offset's position has been placed far away from the drawing scene to make sure it doesn't affect the drawing's deformation. You can bring back the offset and give it the first curve's position. The Envelope deformation lets you animate the offset of each curve separately. The offset no longer needs to be placed far away.

How to transfer a curve's position to its parent offset

1. In the Node view, select the root Offset and the first curve.

2. From the top menu, select **Animation > Deformation > Set Curves and Offsets Independent from Parent**.
3. In the Node view, select only the first curve node.

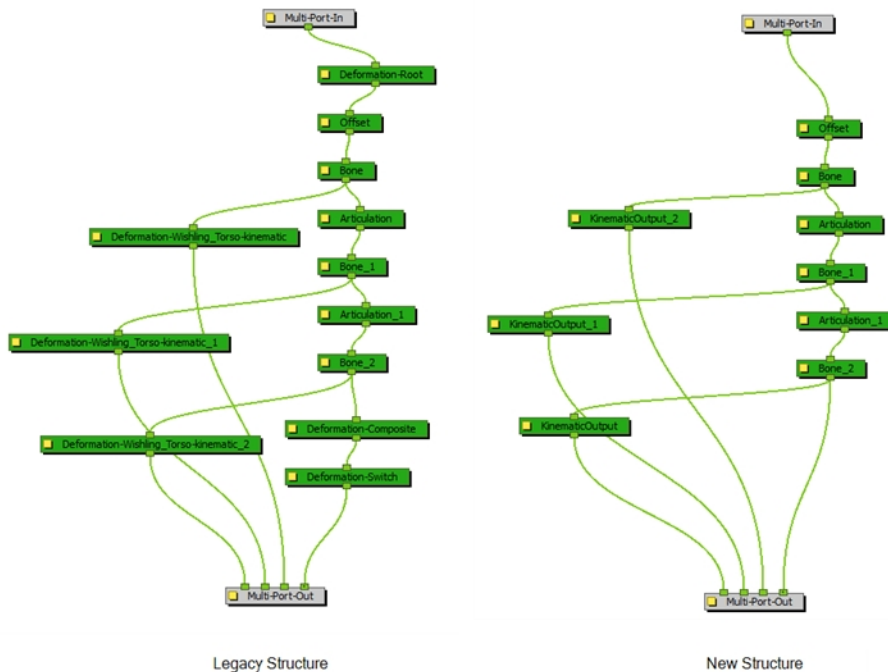

4. From the top menu, select **Animation > Deformation > Transfer Curve Values to Offset**.

In the Node view, the first Curve node is disabled and the values are transferred to the parent Offset node.

Converting Legacy Deformation Chains

You can also convert a legacy deformation rig to the new format using a script. You can select which chain you want to transform. Certain legacy nodes will remain in the structure to make sure the integrity of your original puppet is maintained.

How to convert legacy deformation chains to the new structure

1. In the Node or Timeline view, select the deformation group containing the chain you want to convert to the new structure.
2. In the Scripting toolbar, click on **TB_ConvertLegacyDeformation**. If the script is not available in the toolbar, you can load it.
 - In the Scripting toolbar, click on Manage Scripts
 - In the Script Manager dialog, in the File column, select the **TB_ConvertLegacyDeformation.js** script. If you cannot find the script in the list (most likely due to a software upgrade installation), you can load the script through the Script Editor view from the default resources folder—see Importing Scripts in the Scripting guide.
 - In the Functions column, select **TB_ConvertLegacyDeformation**.
 - Click the Right Arrow button to move the function to the Scripting toolbar.

- Click **OK**.

The legacy chain is converted.

Chapter 10: Gaming in Harmony

There are two main pipelines for exporting data from Harmony to your game engine:

- [Raw Game Data Export](#) on page 666
- [Frame-by-Frame Export](#) on page 667

Creating Animation in Harmony

When creating character rigs and animation for games, there are a few things to think about before starting. Artists and programmers should work together to make sure their needs are met.

- What platforms will your game be create for? Windows, Mac, Mobile, iOS, PS, XBOX, etc.
- What game engine will you be using?
- What will be animation style used to create the look of the game? Hand drawn, cut-out, with textures, etc.

These are just a few of the questions to consider before getting started. They all have an impact on how you design, build, and animate characters.

For example, if you're planning a mobile game for smart phones, then you will most likely want to keep your game under 50 MB, so it can be downloaded without having to be on Wi-Fi. In that case, your most important consideration is to create efficient characters with very tight sprite sheets and reuse a lot of the animation to keep the file sizes small. During the process, you will need to:

- Rig and animate characters in Harmony.
- Extract the Harmony data.
- Import the Harmony data into the game engine.

Keep in mind, if you're working with a custom engine, you can also process the Harmony data that's exported and use it in a custom game engine. If you need assistance with adapting data for your engine, contact store.toonboom.com/contact/support.

If you're making a game for consoles, like the PS or Xbox, then you have the freedom to create larger textures. You may want to animate frame-by-frame, or you may want to animate with a cut-out character.

If you're simply going to export on a frame-by-frame sequence, then you can use all the tools in Harmony without limitations. You can then process an exported image sequence into a sprite sheet.

Raw Game Data Export

Raw game data export is appropriate when you want the file sizes to be as small as possible. Toon Boom lets you extract all the data from Harmony to incorporate into a game engine. You can extract the skeleton information, drawing information, and keyframe animation data, as well as deformations (bones and articulations only), cutter, transparency nodes, and timing columns.

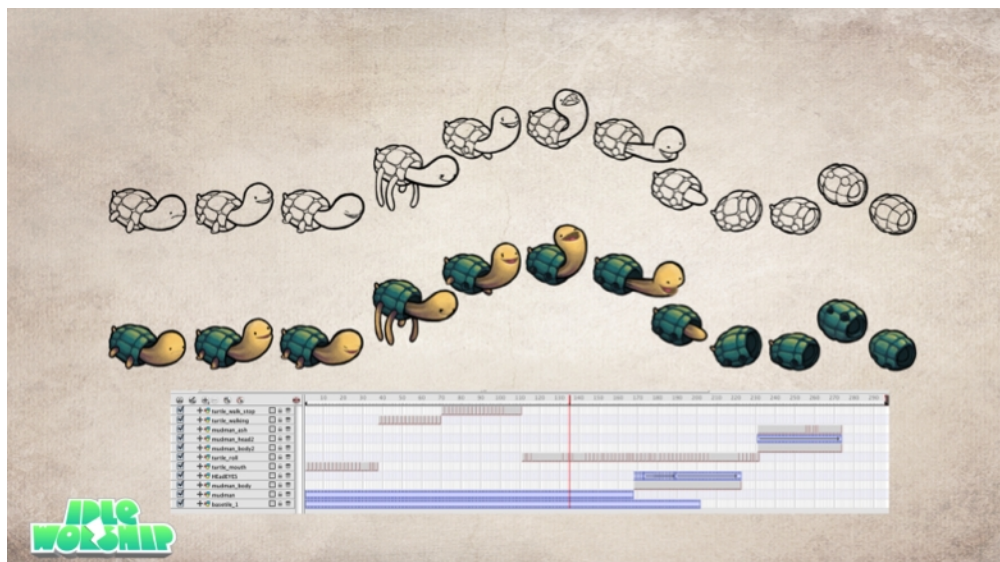

- **Advantage:** This is the lightest export, and will keep file sizes small which is ideal for mobile applications.
- **Disadvantage:** You are somewhat limited in the tools you can use in Harmony. You can use tools like Morphing as well as Curve and Envelope deformers, but you'll need to bake it out to drawings so they're interpreted properly in the game engine. You can use Cutter effects (masking), but you cannot cascade them, meaning you cannot have more than one in a hierarchy chain. The Game Bone deformers can be used on your rig with having to bake it to drawings.

However, even with these limitations, you can create really great cut-out character animation in Harmony and extract all the data. By moving, rotating, scaling, and skewing the different drawing layers, you can create advanced looking animation.

When you extract the data, you'll have sprite sheets that contain only the drawings of the body parts used in your Harmony scene file. You can also support multiple animations, such as idle, run, and jump, and reuse the same skeleton and drawings when possible by simply exporting new animation data.

Toon Boom has fully integrated this solution with the Unity game development rendering engine. If you are creating your game in Unity, you have a seamless pipeline without the need to re-treat the data in your game engine.

Frame-by-Frame Export

You can export from Harmony using an image sequence, which can be recompiled into a sprite sheet.

Advantage: You can use any of the tools in Harmony when you animate!

Disadvantage: These sprite sheets can become quite heavy and end up as large textures to process in the game. This may be fine for many games, like console games, but when you're doing game development for mobile devices, such as iOS or Android, you need to be very light on your texture space. Also, file sizes should be kept under 50 MB to facilitate downloading without needing to be connected to Wi-Fi.

There is a script available in Harmony that allows you to export your animation in frame-by-frame to the EaselJS game engine. EaselJS is a javascript web compatible game engine. It uses a json data structure to map each frame to an entry in the sprite sheet. The data structure is easy to understand and can be adapted or converted to a different game engine if you need to.

To export to EaselJS, you need to add the script in the Scripting toolbar (TB_ExportToEaselJS). This script is included in Harmony. See the Scripting guide for more information on how to add the script to your Scripting toolbar and the interface parameters.

About Game Asset Creation

In this section, you'll find guidelines for rigging, deformation, cutter and many useful animation tips.

Game Rigging Guidelines

For complete procedures on how to rig a character, see—[Rigging](#).

The following is a list of general guidelines to keep in mind when rigging your character. As you're planning the character rig for your game, keep in mind the style of the character, and create your custom colour palette. However, there are some limitations to consider if you plan to extract the game data:

- Set your Harmony scene to be a square resolution (e.g. 1024 x 1024). You can do this in the Scene Setting dialog box—see the Reference guide .
- Draw the art on the Line Art and Colour Art layers only. The information contained in the Overlay and Underlay will not be exported to Unity. It is however safe for using as a reference layer, just not anything that will be exported.
- Create rigs in the Timeline view only. The Node view can have complex connections that are not always interpreted well by game engines.
- Nudge layers in Z space if you need to reorder layers. However, significant Z offsets are not supported within a character rig.
- Make every layer in your game engine a separate scene in Harmony. If you have two characters at different depths, put them in separate scene files.
- Character rigs in groups at the root level of your Harmony scene will render to a single plane in Unity, but use separate sprite sheet and animation data sets. Keep this in mind for scenes in which you may have more than one character interacting with each other.
- Don't use any effects. Effects like colour overrides are not interpreted by game engines. Use only direct hierarchy, drawing swaps, and keyframe animation.
- Set your pivot points on Peg layers using the Rotate tool to set the pivot on the entire layer. Peg pivots are recommended over drawing pivots. You should also set the pivot points on your drawing layers, even if you don't animate on them, as this will allow you to retrieve the information later on in the game engine if you need to put a locator on a drawing layer.
- Don't use Morphing. This is not yet supported in game engines.
- Both Morphing and Deform can be used and then baked out to individual drawings. These drawings will then show up as new drawings in your sprite sheet. Be wary of doing this too often as it will increase your texture space!
- For your pegs, when you animate, use Bezier curves and set them to Separate. If you use 3D Path, it's heavier than Separate.
- Be mindful of where you put your character before exporting. The master pivot of your exported game object will be the center of your Harmony scene (0,0).
- Be sure to have a Display at the end of your hierarchy.

Keeping these tips in mind will allow you to create a tight, efficient 2D game character in Harmony while taking advantage of all the great tools.

Here are some things you should do:

- Create a simple parent-child relationship hierarchy in the Timeline view.
- Use peg layers to contain keyframe animation data, set to Separate Position.
- Use drawing layers to draw on, creating new drawings when needed.

- Use the Rotate tool to set the pivot points on the peg layers.
- Name your layers properly so if you need to fetch a specific layer's pivot point later on in the game engine, you can easily recognize the layer you need. If you have a top-level Group A, which has a child group inside it (Group B), and the drawing layer is a child of Group B, then the drawing layer is exported as A_B_DrawingLayer.
- Set your anchors and props, see—[Setting Anchors and Props](#)

You can use any of the drawing tools you want: Pencil and Brush tools, textured lines, solid areas, and gradients. Each individual drawing will be rendered out and assembled into a sprite sheet later.

NOTE: Because the Unity game engine does not support Unicode characters, it is recommended to avoid using it in scenes intended for games.

Game Deformation Guidelines

Harmony can export deformations to the game engine XML format. Only hierarchies made of Game Bones can be successfully exported. In addition, Kinematic Outputs were implemented to complement your game bones—see [About Game Bone Deformation](#) on page 636.

The deformation in the game engine SDK does not behave exactly as the deformation in Harmony.

To comply with most game engines and maintain fast calculations, the SDK implements a linear base skinning algorithm to linearly blend the bones at articulations. You may notice some differences depending on the curvature of the articulations used.

NOTE: * Not currently available in the Cocos2d-x implementation of the game engine SDK.

Game Cutter Guidelines

The cutter, or mask, operation in Harmony is used for cutting off drawings with custom shapes. The game engine SDK implements both cutters and inverted cutters with the following limitations:

- For a sprite, only a single cutter drawing can be applied when it is rendered. This also applies to a composite of multiple matte drawings. The game engine SDK will only use the first matte drawing during rendering and discard the others.
- A deformed drawing cannot be cut, but a cut drawing can be deformed.

NOTE: * Not currently available in the Cocos2d-x implementation of the game engine SDK.

Creating Metadata Notes

As you create assets for your game in Harmony, you may want to make notes about the scene or specific parts of the character or props for the programmer. These embedded notes that will be exported with your assets to Unity are known as metadata.

How to access the Metadata Editor view

- In the top-right corner of a view, click the Add View **+** button and select **Metadata Editor**.
- In the top menu, select **Windows > Metadata Editor**.

How to create scene metadata

1. In the Metadata Editor view, in the Scene Metadata section, click on the plus **+** button to create a new metadata entry.

The Add Metadata dialog box appears.

2. In the Add Metadata dialog box, enter the name of your new scene entry.

NOTE: For any anchor or prop information created within the Metadata Editor, the naming convention must always use the prefix "game.". The term "game." is recognized automatically by Unity as a metadata information. For example: *game.Armor001*.

3. Click **Add and Close** if you only intend to add a single entry. Click **Add** if you intend to add multiple entries. Continue adding multiple entries, clicking **Add** after each one. Click **Close** when you are through.
4. In the Metadata Editor view, double-click on the value field for the first entry to make it editable.
5. Enter the value information for this entry.
6. Continue adding value information for all your entries.

This information will be exported with your Harmony assets. Once in Unity, scene Metadata will appear in Inspector view > Metadata when the asset is selected in the Hierarchy view.

How to create node metadata

1. In the Timeline view, click on the layer to which you would like to attach metadata.

The name of the layer appears near the top of the Node Metadata section.

2. In the Node Metadata section, click on the plus **+** button to create a new metadata entry. The Add Metadata dialog box appears.
3. In the Add Metadata dialog box, enter the name of your new node entry.

NOTE: For any anchor or prop information created within the Metadata Editor, the naming convention must always use the prefix "game.". The term "game." is recognized automatically by Unity as a metadata information. For example: *game.Armor001*.

4. Click **Add and Close** if you only intend to add a single entry. Click **Add** if you intend to add multiple entries. Continue adding multiple entries, clicking **Add** after each one. Click **Close** when you are through.
5. In the Metadata Editor view, double-click on the value field for the first entry to make it editable.
6. Enter the value information for this entry.
7. Continue adding value information for all your entries.

This information will be exported with your Harmony assets, more specifically, this information will be linked to the selected layer. Once in Unity, scene Metadata will appear in Inspector view > Metadata when the asset is selected in the Hierarchy view.

Game Animation Tips

When animating for games, depending on the type of game you're creating, you may need to limit your animation. For example, if you're creating mobile games and you want to keep the file sizes small and playback fast on all devices, then limit yourself to simple keyframe animation with as few drawing swaps as possible. If you're creating console games, you have the freedom to create more drawings and have a higher complexity. You can explore with your programmer the limitations of the platforms you're exporting to, and what your game engine supports.

Here are some tips for efficient, lightweight animation:

- Use mainly transformations, such as move, rotate, scale, and skew.
- Create additional drawing swaps when needed.
- If you use Curve and Envelope deformers or Morphing, you'll need to bake out the drawings for export. Be careful when doing this, as you may want to keep the number of drawings small. Don't bake out an entire sequence, just selected drawings. You don't need to bake the Game Bone deformers.
- The bigger the drawings are in the Drawing view, the more pixels they will occupy in the texture size on the sprite sheet. When setting up your rig, make sure to not scale individual layers by using a keyframe with the Transform tool. If you want to scale things up or down, use the Select tool. This will keep things the same relative size on the sprite sheet. When you export the sprite sheets, in the script you can also set the resolution of the sprite sheet so the drawings can be scaled down for smaller devices.
- Only drawings which are exposed in the scene will be exported to the sprite sheet. For example, if you have 10 drawings in your Library view, but only two of them are showing in your scene, only those two will be exported. This keeps the sprite sheet as tight as possible.

Animating Multiple Sequences

You will always have multiple animations for your characters. For example, an idle sequence, a run sequence, an action sequence, and so on. You need to work in a specific structure so you can export all of these animations to a single sprite sheet.

There are two different work flows that you can use:

- Workflow 1: Separate Scenes
- Workflow 2: Separating Using Scene Markers

Workflow 1: Separate Scenes

First, create a scene file with the name of the character, such as `Space Duck`. This is the file where you can create or import your game rig. In the top menu, select **File > Save As New Version**, and give this new version the name of the animation. For example, `Idle`.

Every time you need to do a new animation using the same character, perform a Save As New Version. In the end, you may have something like this:

Scene: Space Duck

Versions:

- Idle
- Run
- Jump
- Shoot

When you run the export script, it will export the drawings from the current scene into the export folder. It will also let you know if there are any other scene versions that were already exported to that folder. If so, then it will recompile the sprite sheet to include all the drawings from all the animations. This allows the maximum possible reuse of drawings.

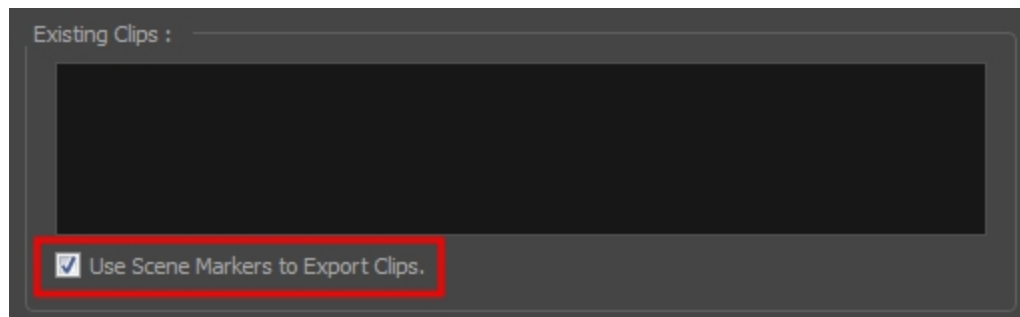

Workflow 2: Separating Using Scene Markers

You can also create all of your character animations in a single scene, one after the other, such as idle, run, jump and shoot. Then use scene markers to mark and separate the individual animations, see [Creating Scene Markers on Frame Ranges on page 379](#)

When you are marking individual animation frame ranges, be sure that they start and end with a keyframe. Do not create scene markers for a range of frames that starts or ends in the middle of an interpolated movement.

When exporting your sprite sheet, in the Export To Sprite Sheet dialog box, be sure to check the **Use Scene Markers to Export Clips** option.

The animated clips are divided and listed in the stage.xml in the same way that they would appear if you had exported each animated sequence from separate scenes to the same file location.

Using the Harmony Game Previewer

If you are not a developer and would like to see if your animations and rigs will work once imported in Unity, you can use the Harmony Previewer application. You can visualize your characters in the Unity game engine with no programming required.

How to use the previewer on Windows

1. Download the Harmony Game Previewer for Windows:
 - <https://docs.toonboom.com/go/download/GamePreviewer-12-2-windows>
2. Extract the following to your hard drive:
 - GamePreviewer-[version].exe
 - GamePreviewer-[version]_Data folder
3. Copy your export from Harmony to this folder:
 - GamePreviewer-[version]_Data\StreamingAssets\HarmonyResources\
4. Start the Game Previewer application.
5. Select the export you want to preview.

How to use the previewer on Mac OS X

1. Download the Harmony Game Previewer for Mac OS X:
 - <https://docs.toonboom.com/go/download/GamePreviewer-12-2-mac>
2. Extract the GamePreviewer-[version].app.
3. Right-click on the GamePreviewer-[version].app and select **Show Package Contents**.
4. Copy your export from Harmony to this folder: Contents/Data/StreamingAssets/HarmonyResources/
5. Start the Game Previewer application.
6. Choose the export you want to preview

About Export to Unity

If you have a custom game engine, you can take the exported Harmony data and proceed with your usual process. Or you can modify the export script to fit your convention.

Before exporting a scene:

- Be sure to set your Display as **Display** and not Display All.
- Be certain to save your scene. Harmony makes the export based on the tvg files, any unsaved updates you have added will not be exported.
- Set your Harmony scene to be a square resolution (ex. 1024 x 1024). Select Scene > Scene Settings.

The Transparency parameter attached to the element node is exported along with the animation. You can set the transparency through the Layer Properties window (Advanced tab).

Clearing Scripts

If you were using Harmony 12.1 or earlier, it is strongly suggested that you clear your scripts before exporting animation for the first time. This will ensure there's no conflict with previous versions of the scripts and you have the most up-to-date script.

How to clear your scripts

1. Close Harmony if it is open.
2. Browse to the script folder location:

- **Windows:**

- Toon Boom Harmony Advanced: C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony Advanced\1200-scripts

- **Mac OS X:**

On Mac OS X, the Library folder is a hidden folder. To display the folder, hold down the Alt key.

- Toon Boom Harmony Advanced: /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Stage Advanced/1200-scripts

3. Delete the **1200-scripts** folder.
4. Restart Harmony and test the export.

Setting Anchors and Props

Before exporting to Unity, you need to set your anchors and props.

An anchor is an attachment point you can use to bind one or several props to a specific location that is predefined by the anchor.

A prop is a game item that will be attached to an anchor. It could be a stick held within the character's hand, a helmet attached to the character's head...the possibilities are endless. Props are easy to turn on or off, and easily swappable from within Harmony or Unity.

How to set an anchor

1. Create a new Drawing layer and rename it according to the anchor you are creating.
2. Inside the Layer Properties of your drawing layer, make sure that pivot option is set to **Don't Use Embedded Pivot** or **Apply Embedded Pivot on Drawing Layer**. The Apply Embedded Pivot on Parent Peg does not transition well to Unity and you will lose your pivot information.

3. Once this is done, you can use any of the animation tools to reposition the pivot point of your layer, such as the Rotate tool in the Advanced Animation toolbar. You should be able to see the pivot coordinates from the Layer Properties of your Drawing layer. If the pivot is not repositioned, its default place will be at the centre of your Harmony scene (0,0).
4. Once this is set up, select the Drawing layer and click the Toggle Anchor  button in the Game toolbar. You can also make a multi-selection to set an anchor on multiple Drawing layers simultaneously.

The Drawing layer is highlighted in red in the Timeline. Your anchor can now be used to attach a prop.

How to set a prop

1. Create a new Drawing layer or take an existing prop on which you want to attach an anchor.
2. Position the Drawing Pivot of the prop layer using a tool on the Advanced Animation toolbar, such as the Rotate tool. The position of the prop's pivot will align with that of the anchor. Make sure it is positioned accordingly.
3. With the prop Drawing layer selected, click the Toggle Prop  button in the Game toolbar. You can also make a multi-selection to set a prop on multiple Drawing layers simultaneously.

The prop Drawing layer is highlighted in green in the Timeline.

4. Do one of the following:
 - Connect the anchor and prop to the parent peg.

- Connect the prop under the anchor to create a parent/child hierarchy.

Exporting Sprite Sheets

The Export to Sprite Sheets window export to multiple resolutions, generating multiple .xml files and one or multiple sprites sheets depending how many sprite resolutions you defined.

This saves different animations of the same character into the same name. For example, if there's an idle, run, and jump animation, these should all share the same Save Name. You can think of it as the overall collection of animations. Inside are the different saved scene versions whose drawings you can reuse for all the animations in that character set. Each scene version will be displayed as an item in the list.

When you export an animation, only the drawings used in that scene are exported. All the drawings are exported individually first and then atlated together into a sprite sheet.

If you saved multiple animations to the same Save Name (i.e. SpaceDuck: run, idle), then it will reatlas the sprite sheet to include all the drawings from all the animations in that folder, creating a new animation file, but reusing the same skeleton.

NOTE:

Programmers may be interested to note that the XML data exported by Harmony can be converted afterwards to a more optimized binary data structure. To convert XML to Binary format, use the Xml2Bin utility. This utility converts the XML data structure generated through the Toon Boom Harmony software to a compressed binary data structure. This utility is available in the gaming SDK under /HarmonySDK/Source/Utils/.

- Utils/macosx:-Precompiled binary for Mac OSX.
- Utils/win32: Precompiled binary for Windows.
- Utils/Xml2Bin: Xml2Bin sources.
- Utils/Xml2Bin/proj.mac/Xml2Bin.xcodeproj: XCode project for Mac OSX.
- Utils/Xml2Bin/proj.win32/Xml2Bin.sln: Visual Studio 2010 solution for Windows.

The C++ code that handles the data structure can be reused and parsed in your own code if you want to integrate with other game engines.

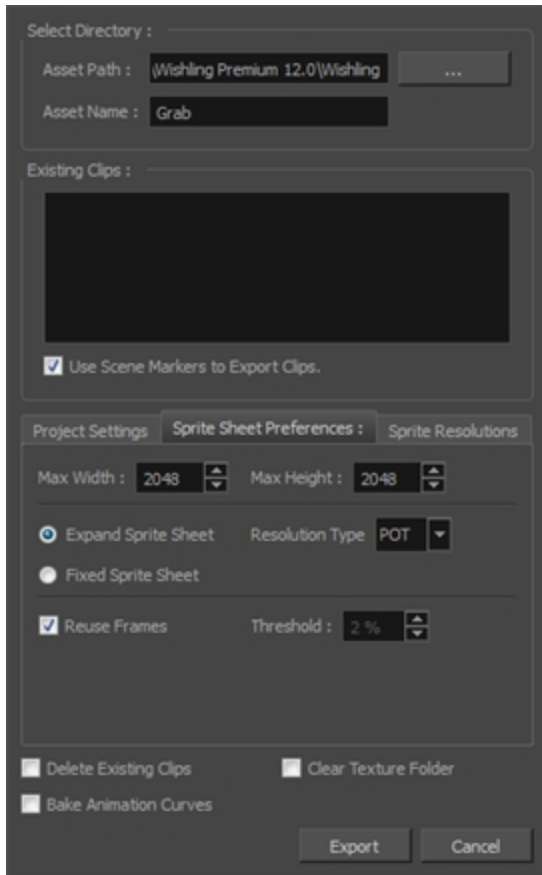

How to export sprite sheets

1. Add the Game toolbar, by selectings **Windows > Toolbars > Game**.

2. Run the script by clicking the Export to Sprite Sheets  button in the Game toolbar.

The Export to Sprite Sheets window opens.

3. Set the Save Path to the correct folder in your Unity project if you want it to update automatically. If not, you can save anywhere, then transfer the animation into your Unity project, or any other game engine you want to use.
4. Set your sprite sheet preferences, see—the Reference guide .
5. Click **Export**.

Exporting to Easel JS

The Export to Easel JS window lets you flatten an image sequence of your animation. Even if you have a fully rigged puppet or a single drawing layer with your animation sequence, the outcome will still be a flattened output of each frame, grouped together in your sprite sheet. This allows for more flexibility and freedom of work as you have access to any tools or effect modules you want to use. However, this can result in heavier files depending on the length, complexity and export size of your animation.

NOTE:

Programmers may be interested to note that the XML data exported by Harmony can be converted afterwards to a more optimized binary data structure. To convert XML to Binary format, use the Xml2Bin utility. This utility converts the XML data structure generated through the Toon Boom Harmony software to a compressed binary data structure. This utility is available in the gaming SDK under /HarmonySDK/Source/Utils/.

- Utils/macosx:-Precompiled binary for Mac OSX.
- Utils/win32: Precompiled binary for Windows.
- Utils/Xml2Bin: Xml2Bin sources.
- Utils/Xml2Bin/proj.mac/Xml2Bin.xcodeproj: XCode project for Mac OSX.
- Utils/Xml2Bin/proj.win32/Xml2Bin.sln: Visual Studio 2010 solution for Windows.

The C++ code that handles the data structure can be reused and parsed in your own code if you want to integrate with other game engines.

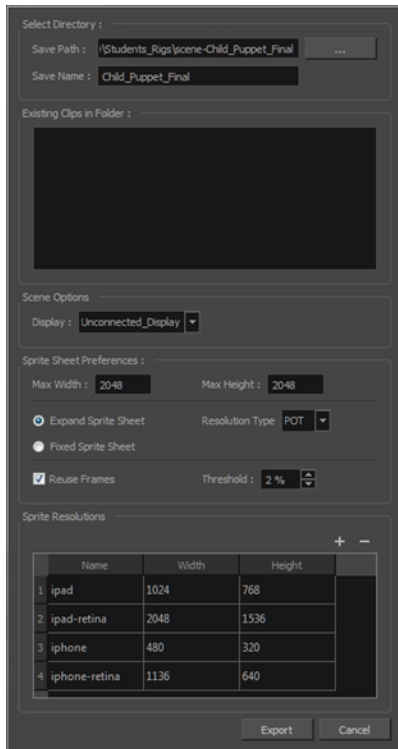

How to export to Easel JS

1. Add the Game toolbar, by selecting **Windows > Toolbars > Game**.

2. Run the script by clicking the Export to Easel JS  button in the Game toolbar.

The Export to Easel JS window opens.

3. Set the Save Path to the correct folder in your Unity project if you want it to update automatically. If not, you can save anywhere, then transfer the animation into your Unity project, or any other game engine you want to use.
4. Set your sprite sheet preferences, see the Reference guide .
5. Click **Export**.

About Working in Unity

The Harmony Gaming Animation Guide is a basic guide on how to import Harmony projects and configure them, design and animate characters, and includes some tips. It is not meant as a guide on how to program games.

About the Sample Unity Project

Toon Boom includes a sample Unity project that contains all the scripts necessary to import the data exported from Harmony. Inside this project is an Assets folder which contains the following folders:

- Plugins
- Scenes (demo scenes and a previewer)
- Scripts (all Harmony scripts)
- StreamingAssets (this is where all the Harmony scene files should be exported to)

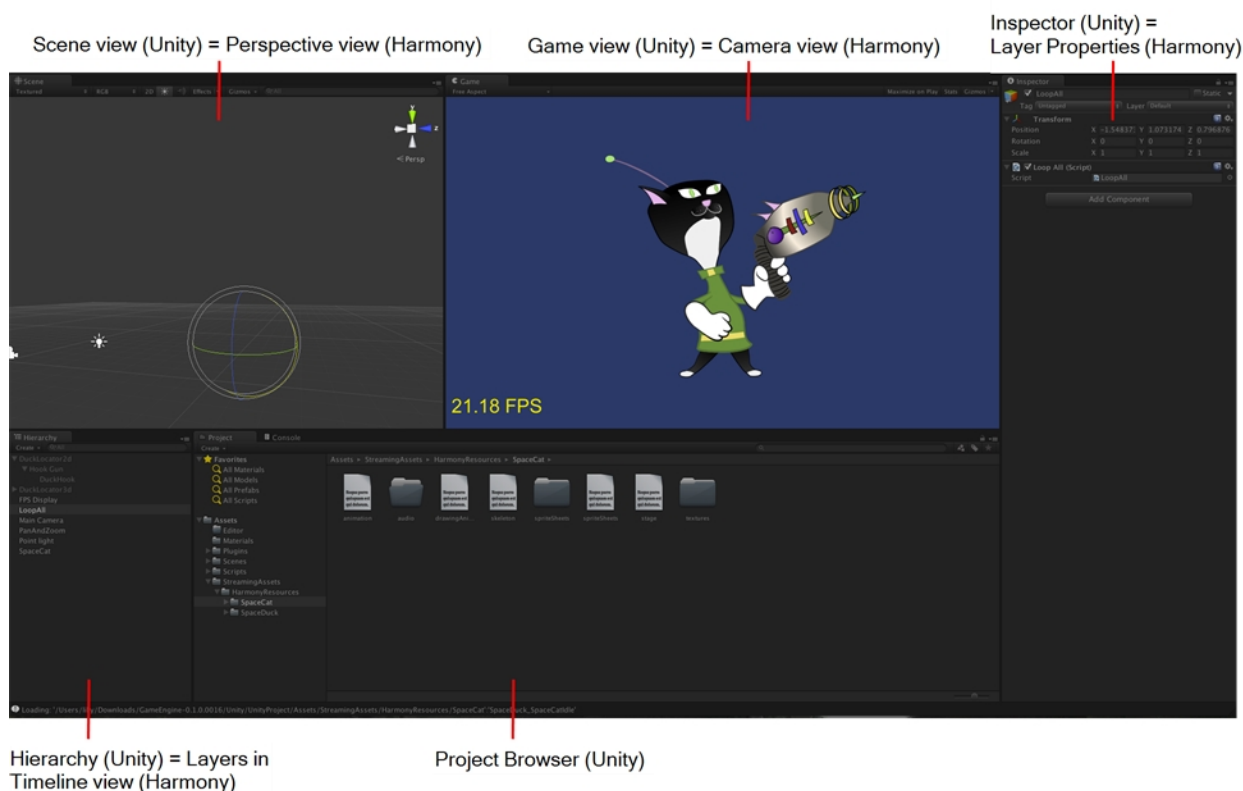

By configuring the Harmony script, you can automatically export animations into the StreamingAssets folder. This way, Unity will dynamically load the most up-to-date assets as soon as they appear in the folder. You can also manually place exported Harmony data into this location.

About the Unity Interface

Here are the main components of the Unity interface and their equivalents in Harmony:

Unity	Harmony	Description
Scene view	Perspective view	This is where you set the scene, selecting and positioning environments, the player, the camera, enemies, and all other GameObjects.
Game view	Camera view	The rendered view from the camera(s) in your game. It is representative of the final, published game.
Inspector	Layer Properties	Displays detailed information about the selected GameObject, including all attached Components and their properties.
Hierarchy	Layers in Timeline view	Displays the hierarchy of elements in the scene, and lets you set up parent-child relationships for different game objects.
Project Browser	---	Lets you access and manage a project's assets.

The main camera displays the scene and is located in the Hierarchy. To show a Harmony object, you must add a special component. With the main camera selected, in the Inspector, select **Add Component > Scripts > Harmony Camera**.

Importing Harmony Files into Unity

Once you've finished creating your artwork and cyclable animated character movements in Harmony, it's time to import them into Unity for game integration.

How to import Harmony files directly into Unity

1. Create a Unity 2D project.
2. The SDK Harmony project needs to be imported to your project in order for the assets to be brought in. Do one of the following:
 - Go to the Unity Asset Store (assetstore.unity3d.com/en/#!/content/31211) and save the Harmony Game SDK file on your computer. Then import it in your project from the following: **Top Menu > Asset > Import Package > Custom Package**.
 - Search for the Harmony Game SDK in the Unity Asset Store, then download and import the package. You can access the Asset Store from the following: **Top Menu > Window > Asset Store**.

NOTE: For each new Unity project, you must repeat step 2 as it contains the necessary files and folders to make the Harmony import process work.

3. Add the exported game object to the scene by going to **Top Menu > GameObject > Harmony >**
 - **Harmony Object:** Lets you browse for the exported Harmony project folder. If you've already saved this to your StreamingAssets folder, you can browse to it through there. Then it adds the Harmony scene to your Unity file, and sets up the rendering, audio, and animation scripts you need to get going.
 - **Harmony Texture Object:** Lets you browse for the exported Harmony project folder similarly to Harmony Object, but creates a Unity plane to render your animation on it.

About Game Objects

GameObjects are the fundamental objects in Unity that represent characters, props and scenery. Basically everything you create in Unity will be a GameObject. There are two main types of GameObject you can use to import Harmony data:

- **Create Empty**
- **Create Other > Plane**

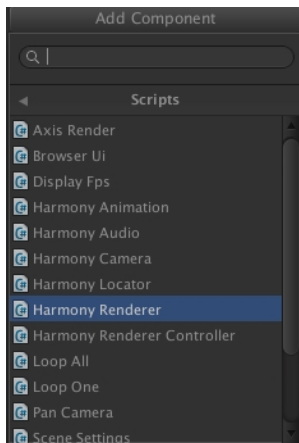

To understand the process fully, there are two examples using an empty GameObject and a plane GameObject with the SpaceCat demo file. Everything you do will be based on the GameObject you create to load your Harmony data.

Using Empty Game Objects

An Empty Game object is a regular GameObject in which you can load the exported Harmony data. All the individual body parts on the sprite sheet come in as separate elements, but are treated as one whole object with a dynamically created bounding box. If you put a transparency on this object, you would see the overlapping transparencies of all the individual objects. This creates a higher-quality render and should be the default if you're not animating the transparency of an object. With this option, direct rendering will read the depth information in the scene but not write it. Note that with this option, the rendering cannot be customized.

How to use an empty GameObject

1. Select **GameObject > Create Empty**.
2. Rename the empty GameObject so it's clear in the Hierarchy. Since we're using the SpaceCat demo file, rename the GameObject to **SpaceCat** by doing one of the following:
 - Double-click on the name and rename it in the Hierarchy.
 - Select the GameObject and rename it in the Inspector.
3. At this point, it's an empty object. Accessing Harmony data is done through scripts.
 - Select the SpaceCat GameObject.
 - In the Inspector, go to **Add Component > Scripts > Harmony Renderer**.

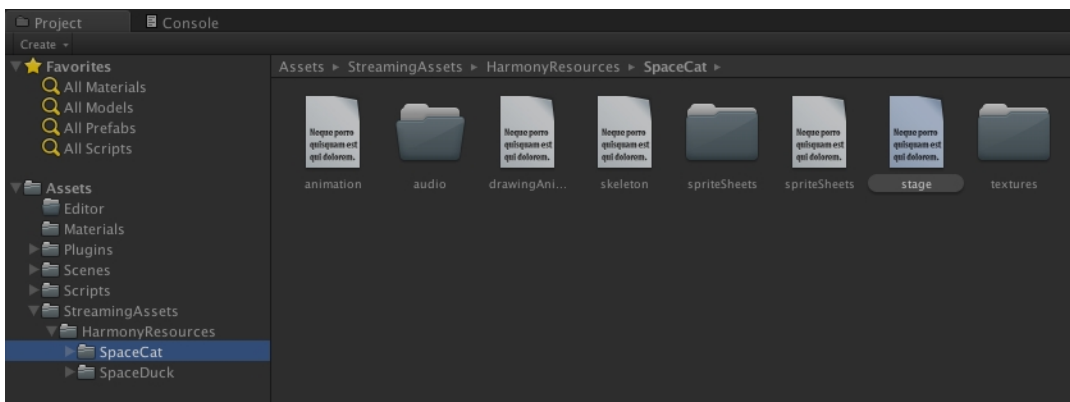

A new section appears in the Inspector called Harmony Renderer (Script).

This will let you load an animation file. You must put the path of the asset relative to the HarmonyResources folder. Before this, you must export from Harmony directly to this folder, or manually copy and paste the data here.

4. You exported a scene called *SpaceCat*. In the Project Folder, place **HarmonyResources/SpaceCat** under the Transform information at the top, under Scale. Set the values to 0.01 for X, Y, and Z because the default Harmony project is for an HD screen.
5. You won't see anything until you define a few parameters:
 - Set the Clip Name Size to 1. A second field will appear, Element 0.
 - Enter the clip name for the animation you want to load.
6. Double-check on the right Clip Name to put in Element 0; you can check the output you exported from Harmony.
7. Double-check the `stage.xml` file, which was exported to the folder you specified when exporting from Harmony. Our default export path is to StreamingAssets, so it will automatically load in the game engine.
8. Look in the Project tab, under **Assets > StreamingAssets > HarmonyResources > [ExportName]**.

You'll find the data that was exported. In this case, we're looking for SpaceCat. Select the file marked `stage` to load the data you want to double-check.

The text data appears in the Inspector.

The name to use for loading the object is the stage name. In this case, `SpaceDuck_SpaceCatIdle`.

9. If your `GameObject` has animation in it, and you want it to load the animation data from the Harmony export, add one more component by doing the following:
 - Select the `GameObject`.
 - In the Inspector, select **Add Component** and select **Scripts > Harmony Animation**.
10. To loop the animation, you must set a `GameObject` to define it:
 - Select **GameObject > Create Empty** and rename it: **LoopAll**.
 - Click the **LoopAll** `GameObject` to display its properties in the Inspector.
 - Click **Add Component > Scripts > Loop All**.

When you play the animation, it will loop as it plays back. The Loop All command simply iterates on all `GameObjects` on runtime and asks them to loop, which is useful when testing the animation. When programming the actual game, you should write additional scripts to control the different elements separately.

Using Plane Game Objects

Renders the entire character to a plane. This renders your character to texture data. If you animate the transparency of the plane, then the transparency of the rendered output is animated; you won't see the transparencies of the overlapping elements. However, you will have one static bounding box the size of the plane that you render to.

Use this option when you want to animate the transparency of a character in a scene. Also, you can write your own custom shaders. Simply set the Render Target to `eRenderTarget`. You can see an example of this in the sample project *DemoRenderTarget*.

How to use a plane GameObject

1. Select **GameObject > Create Other > Plane**.
2. Select **Add Component > Scripts > Harmony Renderer**.
3. Set Size to **1** and Element to **0** on the clip name as per previous instructions.
4. Set Render Target to **eRender Texture**.
5. Render Texture Viewport:
 - **X**: To reposition the animation correctly; it should be $-\frac{1}{2}$ the width of your Harmony project.
 - **Y**: To reposition the animation correctly; it should be $-\frac{1}{2}$ the height of your Harmony project.
 - **W**: Width of your Harmony project
 - **H**: Height of your Harmony project.
6. Use the custom Shader created by Toon Boom to have a transparent background with premultiplied alpha channel. This is what produces nice, antialiased drawings in your output.
7. With the Plane selected in the Inspector, go to **Mesh Renderer > Materials**. Under Element 0, select **UnlitTransparentPremultiplied**.
8. If you're starting with the Toon Boom demo project, this renderer should already be loaded in your list.

You can also write your own custom shaders and use them here.

9. You must also add the animation component. Select the Plane. In the inspector, click **Add Component > Scripts > Harmony Animation**.

Once your Harmony GameObject is imported, you should be able to see your character both in the Scene and the Hierarchy views. From here you can attach one or several props to an anchor.

Attaching Props to Anchors in Unity

An anchor is an attachment point you can use to bind one or several props to a specific location that is predefined by the anchor.

A prop is a game item that will be attached to an anchor. It could be a stick held within the character's hand, a helmet attached to the character's head...the possibilities are endless. Props are easy to turn on or off, and easily swappable from within Harmony or Unity.

How to attach the prop to an anchor

1. Open up your character in the Hierarchy view to have access to both the props and the anchors.
2. Click on the prop you wish to attach, and drag it onto the appropriate anchor.

3. Repeat these steps for each prop and anchor in your project.
4. In the Inspector view, under Frame, you can select which frame you wish to show. If you only had one drawing in your prop, then you will not have multiple options.

5. If part of your character is cut off by the plane of the character, now that the props are showing, you will need to regenerate the mesh. To do so, select your GameObject. After this is done, go to **Inspector View > Render > Generate Mesh**.

Placing Locators in Unity

In Unity, it's possible to assign a target to some part of an imported Harmony animation. For example, in the Space Duck scene, the character has a gun. You may want to attach some other action to this animated gun, such as shooting spheres and cubes out of its end. For this, you need to place a locator at the end of the gun.

You can see some examples of this in the provided Unity project. The first example is in the demo scene *DemoLocator*, which shows a simple cylinder attached to the end of the gun.

The second example *DemoCallback* shows the gun shooting spheres and cubes.

You can access any drawing layer created in Harmony later in Unity and use its pivot point to attach objects and animated sequences. In Harmony, you should set the pivot points on your drawing layers with the Rotate tool.

You can also create an empty drawing layer in Harmony, when setting up your character, to be used later in Unity. Use Create Empty Drawing to create a blank drawing, then use the Rotate tool to set the pivot point on this drawing layer. In the Space Duck example, an empty drawing layer called `hook_gun` was created on which you can attach the locator in Unity.

When you access the imported Harmony character in Unity, you can access the data with a script.

How to set a locator to a part of a character

1. Select **Game Object > Create Empty** to add a new GameObject to extract the target's position, rotation, and scale.
2. Drag and drop the new object so that it's a child of the character.
It becomes indented.

3. Rename the GameObject to: **Hook Gun**.

4. In the Inspector of the target object, select **Add Component > Scripts > Harmony Locator**.
5. Enter the name of the drawing layer to which you want to attach.

6. To find the exact name for the Locator Name, look at the `skeleton.xml` file in the Streaming Assets folder. You can find it in **Streaming Assets > Harmony Resources > Name of Harmony File > skeleton**.

```
<read name="space_duck_gun_details" />
<peg name="space_duck_glow-P" />
<read name="space_duck_glow" />
<read name="space_duck_hand_02" />
<read name="space_duck_hook_gun" />
<peg name="space_duck_arm_02-P" />
<read name="space_duck_arm_02" />
<peg name="space_duck_BOTH_legs" />
<peg name="space_duck_legs_01-P" />
<read name="space_duck_legs_01" />
```

All the drawing and peg layers are listed. In this example, look for `space_duck_hook_gun`. Having drawing layers with distinctive names makes them easy to recognize when you need to retrieve them.

You can copy the name of the layer into the Locator Name to see the Transform information updating dynamically as you run the simulation.

7. Now you can attach anything as a child of this Locator Object. For testing purposes, you could attach a cylinder for example. In a real example, you'd want something to shoot out of the end of the gun, so you can see the Callback example to verify how that works.

Setting Up Collisions in Unity

Extracting the bounding box information is useful when you want to make something collide with your character. When you put a 2D character into a 3D scene, you may want to use Physics to make the 2D character collide with the 3D plane. To use the following scripts, you will need Unity 4.3 or higher.

In the Demo scene, open the DemoPhysics example to see collisions and bounding boxes. In this example, there's a 3D plane and some 2D characters. The 2D characters have a collision defined with their bounding box, and they're also reacting to the physics of the scene to fall with gravity.

Colliders were improved to provide several different types of colliders for use in Unity. You can select polygon colliders and box colliders for a more accurate bounding box.

How to set up collisions

1. Select your imported character.
2. In the inspector, select **Add Component > Physics 2D > Box Collider 2D**.
3. To enable the Physics on the character, go to **Add Component > Physics 2D > Rigid Body 2D**.

NOTE: You can also use 3D physics on the imported files.

You can now adjust the variables and see the results.

About Working with Audio in Unity

When you create scene files in Harmony with audio, the audio is exported into the project folder. However it's important to understand how the game is built to determine the best way to handle audio.

When a game is built from Unity, it creates its own database for holding the assets. Within the export, the Streaming Assets folder is preserved intact. This is what enables the Toon Boom plugin to access those assets on the fly, and render them in the camera to create the final animation you see on the screen.

However when it comes to audio, the game first looks for the audio in the Unity database. So this is the most efficient place to store the audio for the real game.

If audio can't be found in the Unity database, then the game looks in the Streaming Assets folder to find the audio. When it does, it copies the audio on-the-fly back into the Unity database. Since this action is quite costly, don't leave the audio in the Streaming Assets folder for the final game. It's fine to leave it there while you're testing, but not for the final game.

The audio should be copied back into the Unity database, either manually or by automating this process with a script.

Chapter 10: Troubleshooting

Unity Questions

Q. My Harmony asset does not appear in the Unity Editor.

A. There are several possible reasons for this. Check the following:

- Has the HarmonyRenderer plugin been copied to the Assets/Plugins directory? The plugin is named **HarmonyRenderer.bundle** on Mac OS X and **HarmonyRenderer.dll** on Windows.
- Is the clip name valid? Make sure the clip name exists in the stage.xml file.
- Are the binary files up to date? If you updated the Toon Boom Game Engine SDK to a newer version, make sure to regenerate the binary files if you use them so they're compatible with the SDK.

Q. My Harmony asset does not appear in iOS or Android when exported from Unity.

A. There are several possible reasons for this. Check the following:

- Make sure the Harmony assets are copied in the **StreamingAssets** directory. Since the HarmonyRenderer plugin cannot use Unity's asset database, the Harmony assets were packaged as plain files so they are accessible to the plugin.
- Is the plugin for iOS the same version as the one used for the editor? The plugin for iOS is in the **Assets/Plugins/iOS** directory.
- Is the clip name spelled correctly? Windows and Mac OS X aren't usually case sensitive file systems, but iOS and Android are. This implies that an asset that is visible on the editor will not appear on the mobile platform because it cannot be found.
- Make sure the size of your sprite sheets does not exceed the hardware limit of the device you're working on. Otherwise, the texture might not appear at all.
- Is the path to the project folder an absolute path? If it is, it might not work on the mobile device as that path will not exist on the platform. Make sure to use relative paths to the **StreamingAssets** directory.

Q. My Harmony asset does not composite properly with other 2D sprites in Unity. The 2D sprites always appear behind the Harmony assets even if I change the order index in the GameObjects.

A. The 2D sprites from Unity and the Harmony assets cannot currently composite together. There are, however, several solutions for working around this problem:

Use 2D textures instead of 2D sprites. The 2D textures, when attached to a geometry in Unity, will composite like the other 3D elements in the scene and you can change the compositing order by incrementing or decrementing the Z value of the transform.

Use multiple cameras to render your scene in parts. Here's how:

Harmony Camera

1. Create a new camera.
2. Make sure you set the Harmony GameObjects to a specific layer (top-right of the game object inspector).

3. In the camera, set the culling mask to this layer (and the other layers you want rendered in the background).
4. Add the HarmonyCamera component to this camera so the Harmony GameObjects render properly.

Sprite Camera

1. Create a new camera.
2. Make sure to set the 2D sprite objects to a specific layer.
3. In the camera, set the culling mask to this layer (and the other layers you want rendered in front of the 2D sprites).
4. Make sure to set the clear flags to **Depth Only** or **Don't Clear**.
5. Set the depth to be higher than the Harmony camera.
6. Afterwards, if you move the camera, make sure to move both cameras simultaneously if you want to keep Game Objects in sync.

Q. How can you specify the frame rate of the animation? My animation does not play at the same frame rate in Harmony and in the Game Previewer in the Unity Editor.

A. The Game Previewer previews the animation at a default of 24 frames per second. In your game, using the HarmonyAnimation component, you can schedule animations at the speed you want.

Example

```
HarmonyAnimation animation = GetComponent<HarmonyAnimation>();
if (animation != null)
{
    animation.PlayAnimation( frameRate, clipName );
}
```

Q. I cannot see my character in the Scene view in Unity. Is there any way to preview the Harmony asset?

A. Since the rendering of Harmony assets is implemented in a plugin, it does not update any Renderer component in the GameObject, and so cannot be shown directly in the Scene view.

However, you should still be able to preview your assets in the Game view (even when not playing). To help find and position assets, we also added bounding box shapes rendered in the editor and the Game view.

Q. How is memory management handled in Unity for Harmony assets?

A. Most of the memory extensive algorithms are executed in the C++ plugin. The data structure is maintained alive as long as a GameObject refers to it. This means you can instantiate as many clones of a character without reloading the data. Upon destruction, the GameObject will issue a clean-up call to the plugin and delete its associated rendering object. The sprite sheet and animation data are kept alive as long as a single GameObject uses them and a clean-up call is issued once they are destroyed.

Q. The Harmony assets memory does not appear in the Unity profiler. Can we profile the assets memory?

A. The Unity profiler does not pick up Harmony assets in its traces. Since the Harmony GameObject refers to a C++ plugin for its asset management and rendering, its memory cannot be recorded in the profiler. Profilers such as the one provided with XCode or Visual Studio should allow you to track your application's memory including the Harmony assets and should also provide a more accurate result.

General Questions

Q. How can you specify the resolution used for the drawings in the sprite sheet?

A. The drawing resolution is not fixed in Harmony. Since you're exporting the scene to multiple sprite sheets in multiple resolutions, every drawing will have a different resolution in the end. You can use the Drawing view to see the resolution of a drawing compared to the rest of the scene. By enabling the light table in the Drawing view, you will see all of the scene's drawings untransformed in the same proportion as they will appear in the sprite sheet. More specifically, the resolution used in the sprite sheet for a drawing is the size it appears untransformed in the Camera view, scaled to the sprite sheet resolution ("Sprite Resolutions" in the Export Sprite Sheet dialog box).

Once you know that, you can easily adjust the size of a single drawing. Use the Select tool to scale down a drawing and use the Transform tool to scale it back up so it does not change visually in the Camera view. This should allow you to alter the size of drawings in the sprite sheet.

Q. The assets take time to load on mobile devices. Is there any way to speed up the process?

A. Harmony exports an interchange XML format that is intended to be compatible with multiple game engines. However, reading data from the XML files is slow and this is mostly intended to test the assets in your project. At some point, they should be converted to a binary compact data structure that can be read into memory a lot faster than the XML.

You can use the `Xml2Bin` tool provided with the game engine SDK to convert your XML files to binary. This tool is in the `Utils/Xml2Bin` folder and a precompiled version for Mac OS X is available in the `Utils/macosx` folder.

Q. There are problems with the character I exported in the game engine. Pieces are not exported or are not showing in the proper order. What can I do ?

A. To integrate with the game engine SDK, all animations in Harmony must follow certain guidelines. Here are some of the key points for building a character that is compatible with the rendering in the game engine SDK:

- Build your rig in the Timeline view. The game engine SDK data structure is similar to what is displayed in the Timeline view and an advanced node system might not always export properly.
- Because every top level node in your scene will render separately in the game engine SDK, they may not intersect. A top level node is also isolated in its separate sprite sheet to allow the artist better memory segmentation of the character. If you created a character with top level nodes and this was not the intended result, create a top level group or peg to group them all together.
- Use micro-Z ordering if necessary. With no Z ordering, a child layer will appear behind its parent (as it does in Harmony). To change the ordering, add some Z offset to the child layer.
- The export script does not handle plain bitmap images. Toon Boom vector drawings and Toon Boom bitmap drawings are supported though.
- The export script does not handle symbols.

Chapter 11: Library

T-RIG-009-001

Using templates and symbols, you can share and reuse any elements you create in Harmony. The Harmony library lets you store several different elements such as puppets, backgrounds, animations and key poses. In fact, anything you create in Harmony can be stored in the library.

The Library view is where you can store and reuse your artwork and animation in other scenes or build props and puppets.

The library is a storage centre for all production assets; the elements stored in the library are called *templates*. Although it is mainly used for cut-out animation, the library is also useful for paperless and traditional animation processes. The library can contain any asset used in a Toon Boom Harmony production.

Using the library is as simple as dragging the content into the library to store your artwork and then dragging it to the Timeline or Camera view when you want to reuse it.

Additionally, the Library view's Drawing Substitution panel allows you to quickly change the current frame's exposure to one of the existing drawings in a layer. This is especially useful for animating a cut-out character's mouths, hands, eyelids and other such body parts which typically contain several drawings to choose from.

When working on the database, the structure of the library differs from when working on Harmony Stand Alone.

Harmony Server provides three default library folders:

- **Symbols:** The only library folder containing symbols for your project. You can organize the symbols library folder using subfolders, but you cannot create a second library for your symbols. This library is local to your project.
- **Environment:** A folder located inside the Environment folder. Every asset stored in this folder is accessible from any job and scene contained within this environment.
- **Job:** A folder located inside the Job folder. Every asset stored in this folder is accessible from any scene contained within this job.

NOTE: You can create a folder called library in the usa_db folder on the server to create a global library. Once the Harmony application is restarted, a Global library folder automatically appears in every user's library. Every asset stored in this folder is accessible from any scene, job and environment.

About Structure

As you will probably create a large number of symbols and templates, you will soon realize they need to be organized. You can create different libraries and subfolders to easily access your assets. For example, you can create a different library for each project and divide it into several categories, such as:

- Characters
- Props
- Backgrounds

Creating Libraries

There are two ways to create libraries.

- Directly through your operating system
- Using Harmony's interface

Although you can only have one symbol library folder, you can organize it by creating subfolders.

How to create a library folder through your operating system

1. On your computer, create a new folder with a relevant name in the location where you want the library to be stored.

How to create a library folder in Harmony

1. In the Library View menu, select **Folders > Open Library**.
The Browser window opens.
2. Browse for the location where you want to store your new library folder.
3. Click the New Folder button.
A new folder appears.
4. Name the new library folder with a relevant name and click **OK**.
The new library appears in the Library List section.

Opening Libraries

Folders can be opened in Harmony when you require it. You can open any folder on your hard drive or network as a library. Opening a library means linking the folder to your Library view. You only need to open the library once. The library folder is available every time you open the application until you decide to close the library and unlink it.

How to open a library

1. In the Library View menu, select **Folders > Open Library**.

The Browser window opens.

2. Browse to the location of the library folder.

3. Select the folder and click **OK**.

The new library appears in the Library Folders section.

Closing Libraries

You may not always require all the library folders in the Library List. If so, you can close the ones you do not need. Closing a folder does not delete it; it only unlinks it from the Library view. If you want to reopen it, locate it on your hard drive or network and open it in the Library view.

How to close a library

1. On the right side of the Library view, select the library folder to close.
2. In the Library View menu, select **Folders > Close Library**.

The library closes.

Creating Folders

T-ANIMPA-003-009

Symbol and template libraries need to be organized. You can create different subfolders on your hard drive or in the Harmony Library view, so you can easily access assets. By default, any new library you link to your Library view is locked to prevent accidental deletion or modification of symbols and templates. You must obtain the right to modify it before being able to add a new folder to it.

How to create a folder

1. On the left side of the Library view, select the library folder to which you want to add a subfolder.
2. In the Library View menu, select **Edit > Right to Modify**.
3. In the Library View menu, select **Folders > New Folder**.

The new folder appears in the Library. Click on the library containing the new folder and click the plus [+] sign to expand it.

Deleting Folders

You can delete a folder from the library if its contents are no longer needed.

NOTE: All templates and symbols in the folder will be deleted from your hard drive. Once deleted, the data cannot be retrieved.

How to delete a folder

1. In the Library view's left side, select the folder to delete.
2. In the Library View menu, select **Edit > Right to Modify** or right-click on the selected library and select **Right to Modify**.
3. In the Library View menu, select **Folders > Delete Folder** or press Delete.

Renaming Folders

Once you add a folder, you can rename it. This also renames the folder on your hard drive.

How to rename a folder

1. In the Library view's left side, select the folder to rename.
2. In the Library View menu, select **Edit > Right to Modify** or right-click on the selected library and select **Right to Modify**.
3. In the Library View menu, select **Folders > Rename Folder**.
4. Rename the selected folder.

5. Press Enter/Return to validate the operation.

Refreshing Libraries

If you update the content of your libraries through your operating system, you will need to refresh your library folders in the Library view.

How to refresh a library

1. In the Library view's left side, select the folder to refresh.
2. In the Library View menu, select **Folders > Refresh** or press F5.

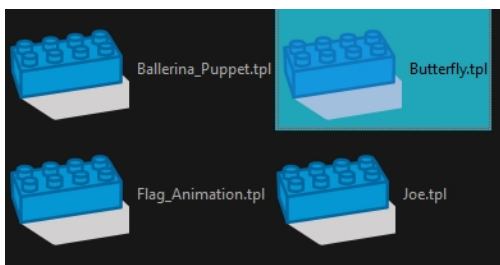

The library displays the new content.

Generating Thumbnails

When you display thumbnails in the Library view, the system generates a series of small images (thumbnails) for you. You can generate template thumbnails yourself, if they do not display or if the process has been stopped.

How to generate thumbnails

1. In the Library view's right side, select the template in which you want to generate thumbnails.

2. In the Library View menu, select **View > Generate Thumbnails**.

The progress bar appears.

Deleting Thumbnails

You can also delete thumbnails if you want to send a template to another user or studio and keep your packages small.

How to delete thumbnails

1. In the Library View menu, select **Edit > Delete Thumbnails**.

All the thumbnails contained in the library are removed.

Searching in Libraries

When working on a movie or series, you will probably end up with many templates and symbols in your library. Using the Search tool, you can quickly find the templates and symbols in your folders.

How to use the Library Search tool

1. From the left side of the Library view, select the library in which you want to search.

2. In the Search field, type the name or partial name of the symbol or template you are looking for.

3. Click the left ◀ and right ▶ arrows to see the previous and next results. The Search engine will look for results within the library master folder and its subfolders. It will not look in other libraries.

About Templates

When you want to reuse artwork and animation from your project in other scenes, you must create a template. A template can be seen as a portable scene or package that you can drag inside your project. A template is an individual copy of the artwork stored in the library which you can reuse in different scenes. Once a template is stored in the library, you can access it from any project.

Creating Templates

T-ANIMPA-003-010

You can create a template using the Timeline view.

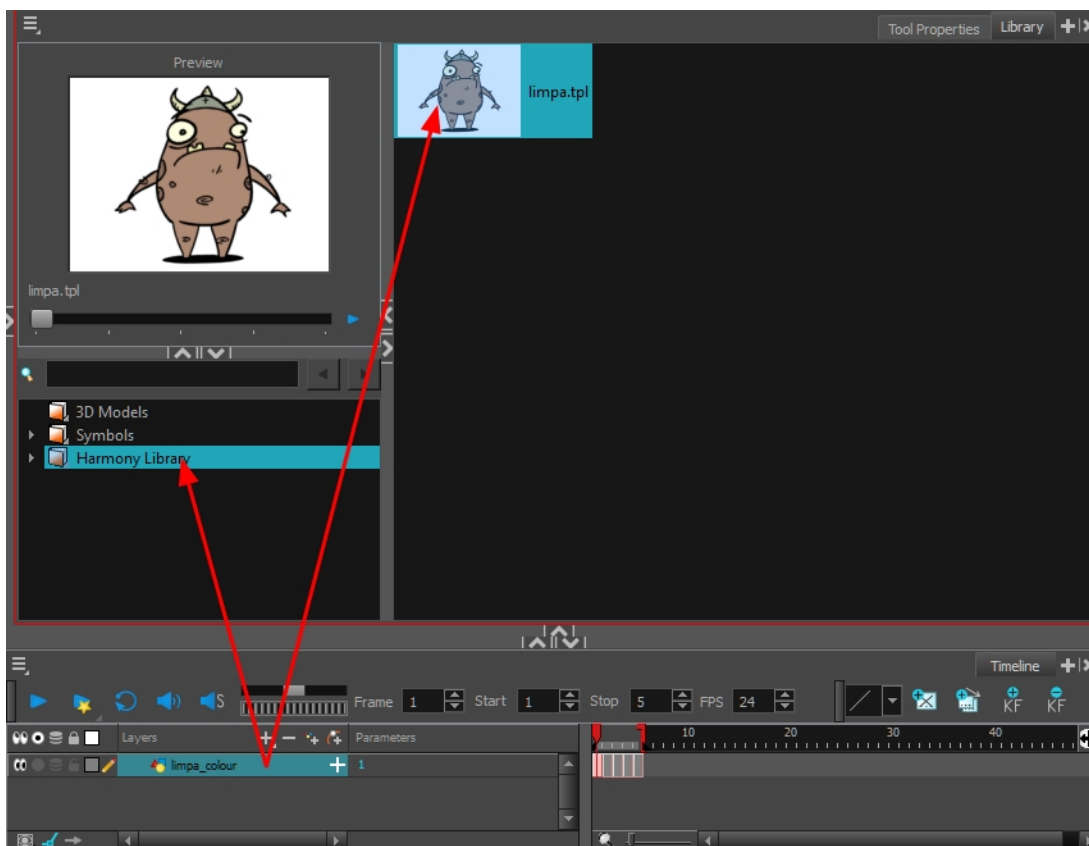

NOTE: If you are creating a template from a character rig master template, you should collapse everything inside a master peg and put a keyframe on the first frame before creating the template.

How to create a template from the Timeline view

1. In the Timeline view, select some cells or layers.

You can create a template from a whole hierarchy of layers by collapsing the hierarchy and selecting the root layer. This can be useful for creating templates based on character rigs or scene backgrounds.

2. In the Library view, select a folder to store the template. By default, a local scene will have a Harmony Advanced Library folder, which is stored in your Documents folder.
3. If the library folder is locked , right-click and select **Right to Modify**.
4. Drag the selection to the chosen library folder.

5. In the Rename dialog box, give the new template a name.
6. Click **OK**.

NOTE: To rename a template once it is created, right-click on the symbol and select **Rename**, or double-click on the template's name.

Deleting Templates

To delete templates from your library, use the Library view. Harmony lets you undo the action if necessary.

How to delete a template

1. In the Library view, select the folder containing the template to delete.

NOTE: If the library folder is locked, right-click on the folder and select **Right to Modify**.

2. Right-click on the selection and select **Delete** or press Delete.

Editing Templates

You can open a template and edit it just like any other project. If you want modify your templates, you can edit them using the Edit Template command.

How to edit a template

1. In the Library view, select the folder containing the template to edit.

NOTE: If the library folder is locked, right-click on the folder and select **Right to Modify**.

2. Right-click on the selection and select **Edit Template**.
A new Harmony application opens.
3. Edit the template.
4. From the top menu, select **File > Save**.
5. In the top menu, select **File > Quit** (Windows/Linux) or **Harmony Advanced > Quit** (Mac OS X).

Importing Templates

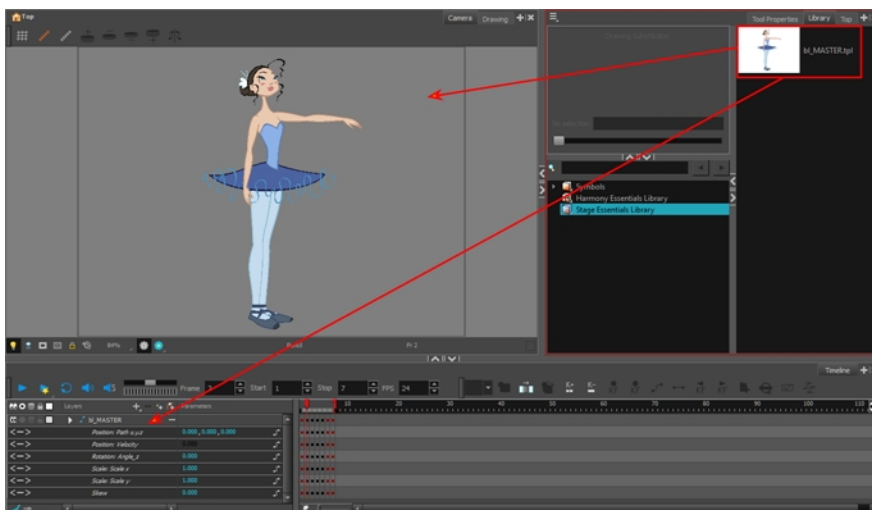

There are several ways you can import templates in your scene.

For greater control over how the action template behaves when brought into the Timeline view, you can use the Paste Special feature—see [Using Paste Special on page 739](#).

NOTE: Dragging a template into your scene copies the content in your Timeline and does not link it to the original. You can modify this individual copy at any time.

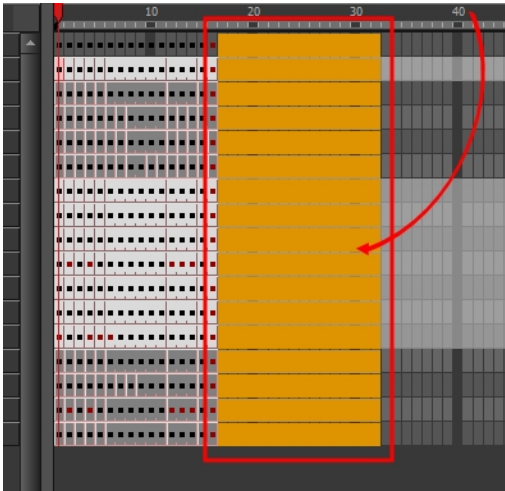

How to import a template into the Timeline or Camera view

1. In the Library view, select the template you want to import.
2. Drag the selected template to the Camera view or to the left side of the Timeline view.

If you drop the template in the Camera view, its layers will be added at the top of your layers list. If you drop a template in the layers list in the Timeline view, it will be inserted between the layers where you dropped it.

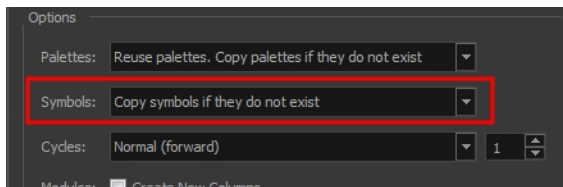

If your template has the same layer structure as a part of your scene, you can drop the template directly onto the frames on the right side of the Timeline view. Instead of inserting new layers into your scene, this will replace the drawings and keyframes in your scene with the ones from the template. This is useful for importing pose or animation templates for characters that are already in your scene.

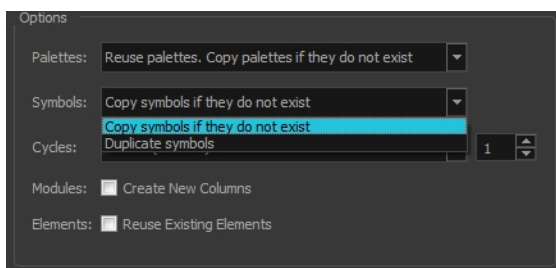

How to import a template with symbols

1. From the right side of the Library view, select the action template that contains symbols.
2. Hold down Alt as you drag it from the Library view to the right side of the Timeline view and drop it next to a template with the exact same rig.

The Paste Special window opens.

3. Select the **Advanced** tab.
4. Select one of the following options from the Symbols menu:

- ▶ **Copy symbols if they do not exist:** This is the default setting for this operation and will prevent symbols in an action template from being copied.
- ▶ **Duplicate symbols:** Makes copies of the symbols in your template.

Opening Templates as Folders

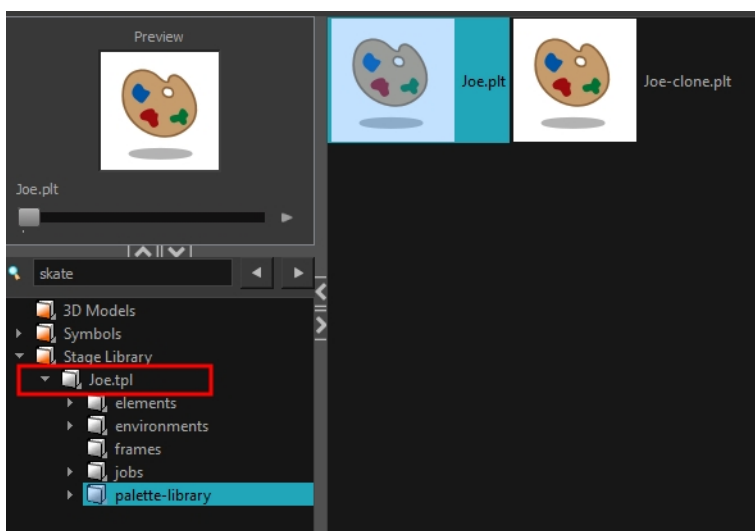

Since a template is like a scene, you can open the template's folder and select elements inside it such as drawings.

Instead of importing the entire contents of a template, you may only want to import a few drawings or a palette. In this case, use the Open As Folder command to import the items you want.

If you want to import a palette, simply drag the palette file into the Palette list section of the Colour view.

How to open a template as a folder

1. In the Library view, select the folder that contains the template to open. If the library folder is locked, right-click on the folder and select **Right to Modify**.
2. Right-click on the selection and select **Open As Folder**.
3. In the library list section, click on the template's folder to display its content.

4. Drag the content to the Timeline or Colour view.

About Symbols

A symbol is a container used to build your props, puppets and looping clips. You can use symbols to contain artwork and animation and manipulate them as a single object. You can also use symbols as a placeholder in which you place a series of different drawings for each body part of your puppets or when you have a repeating cycle. However, symbols are not necessary for creating characters.

When a symbol is exposed in the Timeline view, the symbol's cells are represented as a movie strip.

When you enter a symbol to edit it, you are entering another scene with an independent timeline. You can nest many symbols one inside the other. To help you follow the hierarchy of your nested symbol, take note of the Editing stack at the top of the Camera view which displays the path to your symbol's location. You can click on the symbol's name to move up the chain.

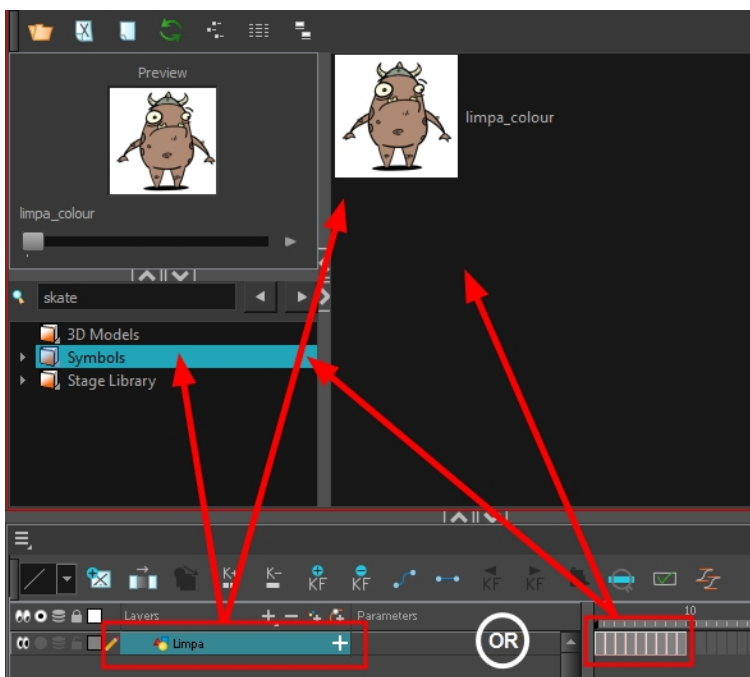

Creating Symbols

A symbol combines animation, artwork or layers into a single object that you can control in one layer. You can also create symbols out of each body part in your cut-out puppets.

To create a symbol, drag your artwork to the Symbol library. When you drag a symbol from the Symbol library into your scene, it will be linked to the original symbol. If you drag a symbol into your scene several times in the Timeline view, they will all be linked to the original symbol. If you modify one, they will all be modified.

How to create a symbol from the Timeline view

1. In the Timeline view, select the layer or cells from which you want to create a symbol.
2. Do one of the following:
 - ▶ From the top menu, select **Edit > Create Symbol**.
 - ▶ In the Edit toolbar, click the Create Symbol  button.
 - ▶ Press F8.
 - ▶ Drag your selection to the Symbol folder in the Library view.

The Create Symbol dialog box opens

3. In the Enter Symbol's Name field, type the new symbol's name.
To rename a symbol once it is created, right-click on the symbol and select **Rename**.
4. Click **OK**.

The new symbol appears in the Library view's Symbol folder. The current selection is not replaced by the new symbol. The new symbol only appears in the library. You must drag it into your scene to use it.

Creating a Symbol from a Drawing

You can create a symbol from a drawing selection.

How to create a symbol from a drawing selection

1. In the Tools toolbar, select the Select  or Cutter  tool.
2. In the Camera view, select the drawing elements to create a symbol.

3. From the top menu, select **Edit > Create Symbol** or press F8.
 - ▶ Clicking the Create Symbol  button in the Edit toolbar will create a symbol from the entire layer. The Create Symbol from Drawing Selection dialog box opens.

4. In the Symbol Name field, type the name of the symbol.
 - ▶ You can also select an existing layer from the Symbol Name drop-down menu. It will add your symbol on the layer's current cell. If there is already an exposure on that cell, the symbol will be added to a new layer.
5. You can choose to place the current selected artwork in the drawing or remove it:
 - ▶ To remove currently selected artwork from the drawing and place it in the new symbol, select the **Cut Artwork From Source Drawing** option.
 - ▶ To keep currently selected artwork in both the drawing and in the new symbol, deselect the **Cut Artwork From Source Drawing** option.
6. Click **OK**.

The new symbol appears in the Library view's symbol folder and in the Timeline view as a new layer.

Creating Empty Symbols

You can create a symbol without any artwork in it.

How to create an empty symbol

1. In the Library view, select the **Symbol** folder.
2. Do one of the following:
 - In the Library view's right side, right-click and select **New Symbol**.
 - From the top menu, select **Insert > Create Empty Symbol in Library**.

The new empty symbol appears in the Library view.

The symbol is ready for you to edit (add content to). To go back to the root timeline, click the Top 🏠 button in the Camera view.

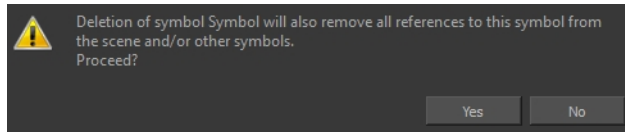

To rename a symbol once it is created, right-click on the symbol and select **Rename**.

Deleting Symbols

When you delete a symbol, it will be deleted from your hard drive. You can use the Undo function to retrieve the data. The symbol cannot be retrieved once you close the application.

How to delete a symbol

1. In the Library view, select the symbol to delete.
2. Right-click and select **Delete** or press Delete.
 - ▶ If the symbol is currently in use in the scene, a warning message displays. Click **OK** to delete the symbol from the library and scene.

Editing Symbols

You can either edit a symbol from the Timeline view or from the Library view.

When you edit a symbol, the drawings contained in it are not placed at the centre of the stage, but are located in the position where they were created. The pivot is translated at the centre of the symbol.

How to edit a symbol from the Timeline view

1. Do one of the following:
 - ▶ In the Timeline view, double-click on the symbol's cell to edit the symbol.
 - ▶ In the Camera view, double-click on the symbol or press **Ctrl + E** (Windows/Linux) or **⌘ + E** (Mac OS X).
 - ▶ Click the Edit Selected Symbol  button in the Camera View toolbar's extra buttons.

You are now inside the symbol and you are able to edit it.

2. Do one of the following:

To return to the project's timeline, click the Top  button in the Camera view's top-left corner, press **Ctrl + Shift + E** (Windows/Linux) or **⌘ + Shift + E** (Mac OS X).

- ▶ In the Timeline view's right side, right-click and select **Symbols > Leave Current Symbol**.

How to edit a symbol from the Library view

1. In the Library view, select the symbol to edit.
2. Right-click and select **Edit > Edit Symbol** or double-click on the symbol.

You are now inside the symbol and you are able to edit it.

To return to the project's timeline, click the Top 🏠 button in the Camera view's top-left corner, press Ctrl + Shift + E (Windows/Linux) or ⌘ + Shift + E (Mac OS X).

Importing Symbols

There are several ways you can import symbols in your scene.

When you import a symbol from the library to the Timeline view it is linked to the original symbol in the library. If you import a symbol into your scene several times in the Timeline view, they will all be linked to the original symbol. If you modify one, they will all be modified.

How to import a symbol in the Timeline view

1. In the Library view, select the symbol you want to import.
2. Drag the selected symbol to one of the following:
 - The Timeline view's left side to import it into the centre of the camera frame.
 - The Camera view to place it at the location where you release your cursor.

NOTE: This may be useful if you saved a character's body parts as separate symbols. If you dropped them into the Timeline view, then they would all appear in the centre, haphazardly one on top of the other. It would be more efficient to arrange them into their correct places as you bring them into the scene.

Expanding Symbols

You can use the Expand Symbol command to extract a symbol's contents and place it on the root timeline. The symbol will not be removed from the Timeline view. Its contents will be copied and inserted into the root timeline. The symbol's layers will be parented to it in case you created motions and transformations on the drawing layer that contains the symbol. Breaking the hierarchy could result in the loss of any scaling and animation you may have created.

You can also expand a symbol within a group to avoid crowding the timeline with a series of layers. When you expand the symbols, the layers will be contained in a group node that you can expand to see the content.

How to expand a symbol

1. In the Timeline view, select the symbol to expand.

2. From the top menu, select **Edit > Expand Symbol** or press Shift + F8.

How to expand a symbol in a group

1. In the Timeline or Node view, select the symbol cell or symbol node you want to expand.

2. From the top menu, select **Edit > Expand Selected Symbol in a Group**.
3. In the Timeline view, click the plus sign (+) to see the group content. In the Node view, click the **Expand Arrow** to enter the group.

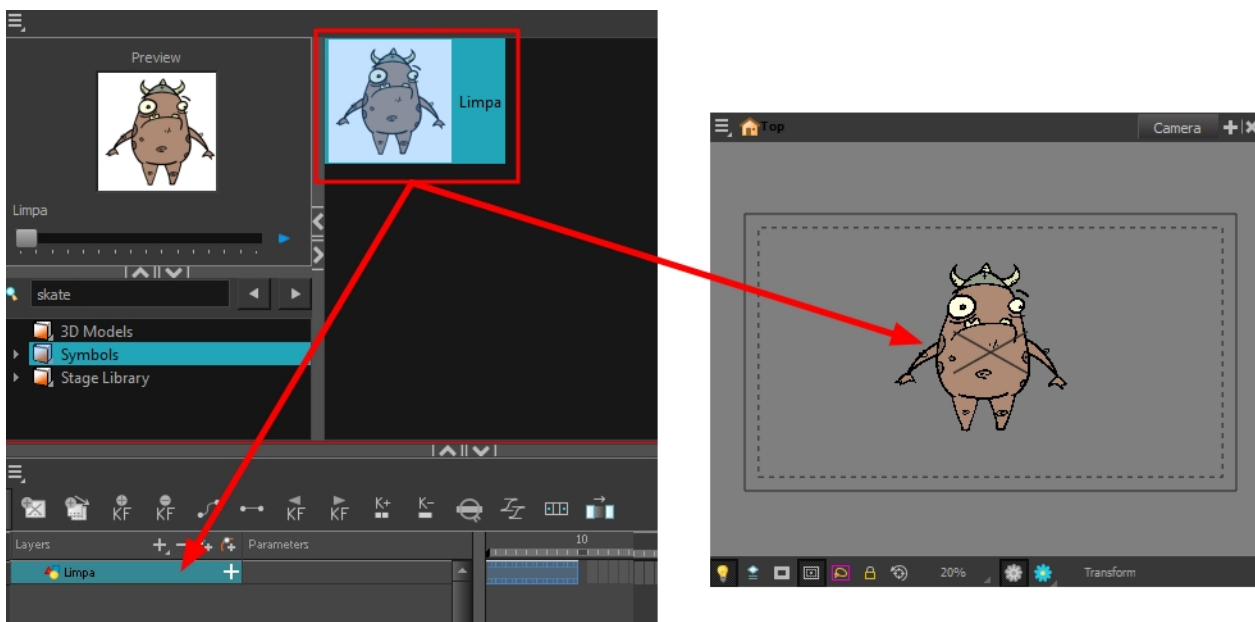

Converting Symbols to Templates

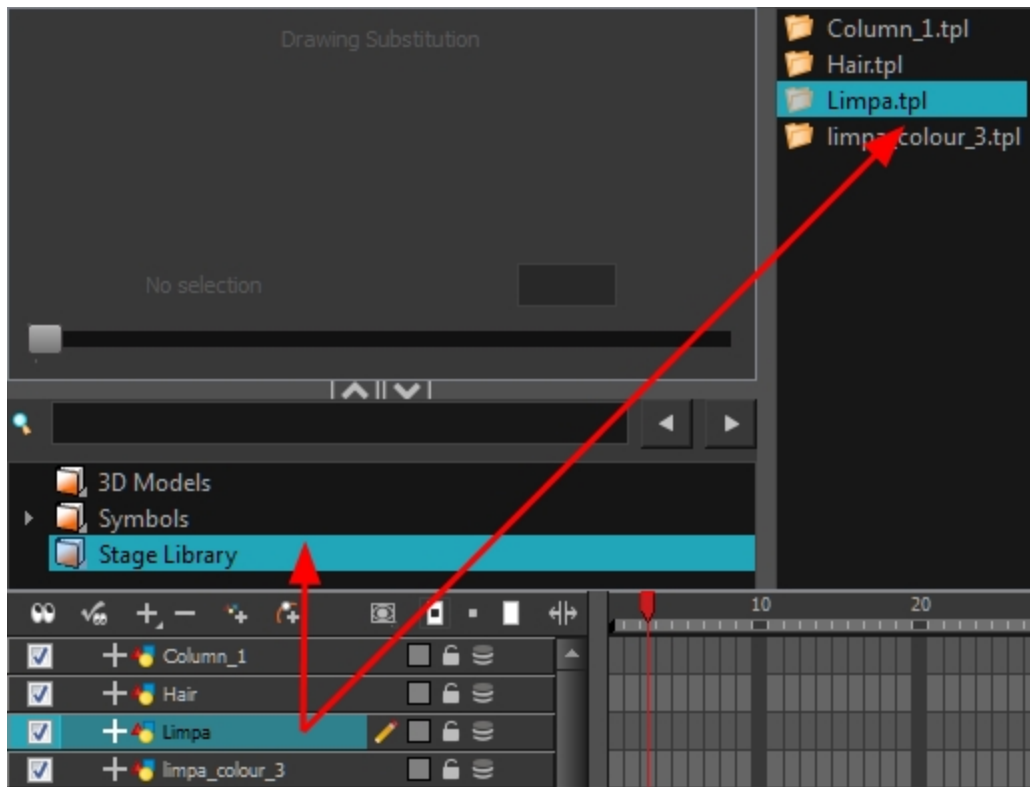

A symbol is local to the project and cannot be accessed directly from other scenes. To reuse a symbol's content in another scene, you must create a template. This conversion breaks the drawing's link with both the original scene and symbol. It then becomes a separate entity that you can import into other projects.

How to convert a symbol into a template

1. From the Library view, select the symbol to convert into a template and drag it to the Camera or Timeline view. If you drop your symbol into the Camera view instead of the Timeline view, it will not be placed in the centre of your camera frame, but rather wherever your cursor drops it within the camera frame.

2. In the Timeline view, select the symbol's cells or layer and drag it to the Stage Library folder or to any other library folder. Make sure you have the right to modify the library folder.

3. In the Rename dialog box, rename the new template.

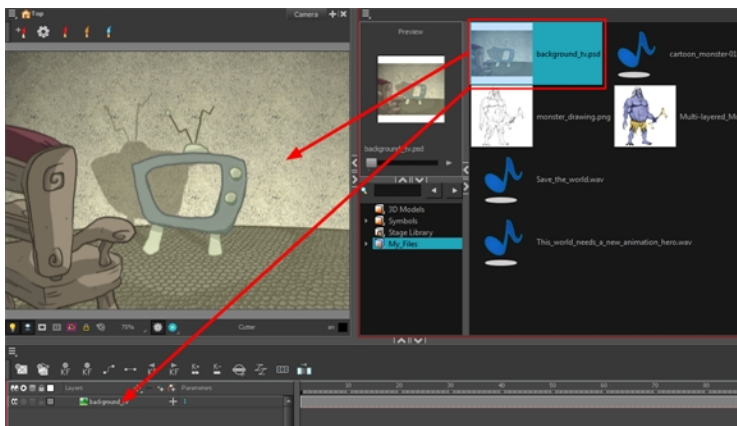

4. Click **OK**.

Importing Files in the Library

Harmony lets you import sound files and images directly through the Library view. Simply open the folder containing your files in the Library view and drag them directly from there.

How to open a file through the Library

1. In the Library view menu, select **Folders > Open Library**.
2. Browse for the folder containing the files you want to import.
3. Click **Open**.
4. From the Library's template list, drag the file you want to import in the Timeline or Camera view.

Using Paste Special

When you import a template in the Timeline view, all layers are created as well as drawings and keyframes. You can choose to import only the keyframes without the drawings or import only the drawings that are not already in your layers. You can adjust the behaviour using the Paste Special dialog box. When you import a symbol in your scene, its full length is exposed by default. If you import a symbol in the Timeline view's left side, all the frames will be exposed. However, if you import it into an existing layer, you can use the Paste Special dialog box to adjust the import behaviour to fit your requirements. Once you set the parameters, Harmony will reuse them each time you import a symbol in the Timeline view's right side until you set new parameters.

How to open the Paste Special dialog box

1. In the Library view, select the symbol or template to import.
2. Press **Ctrl + B** (Windows/Linux) or **⌘ + B** (Mac OS X) and drag the selection to the Timeline view.

NOTE: Drop the selection in the Timeline view before releasing the keyboard shortcut key.

The Paste Special dialog box opens.

3. Set the parameters—see the Reference guide .
4. Click **OK**.

Chapter 12: Cut-out Animation

Harmony provides some great tools for rigging and animating cut-out character models. You can make simple rigs or give your characters flexible capabilities using peg hierarchies, groups, cutters, and deformers, among other things. You can create basic animations with the Transform tool, or more advanced animation with Deformers. Harmony also supports advanced onion skin and image swapping features to help you animate efficiently and quickly.

About Animating with the Transform Tool

The Transform tool is the main tool to use when working with a cut-out character. The Transform tool has many useful functions:

Using the individual Rotate, Translate, Scale and Skew tools is not recommended, as they move each piece from their own pivot point. They are compositing tools. The Transform tool creates a global selection, so when many parts are selected, you can move them as one unit. The Transform tool is highly recommended for cut-out animation.

When animating with the Transform tool, make sure to select the right selection mode. In this example, make sure that the Peg Selection  Mode is disabled in the Tool Properties view or it will limit the selection in the Camera view to pegs only.

If there are hierarchy connections in the cut-out character, the Transform tool will also be used as the Forward Kinematics equivalent.

The Transform tool can be used on any kind of rigging.

When many parts are selected with the Transform tool, the first selected part's pivot will be used as the global selection's pivot. This pivot can be moved temporarily for the animation. When you offset the pivot, the permanent pivot is displayed as a ghost.

NOTE: The interpolation of the animation poses is always calculated from each individual part's permanent pivot. If there's a parent peg on a limb, make sure to select it instead of making a selection of each part to avoid setting individual keyframes.

Animating with the Transform Tool

The Transform tool allows you to move, rotate, scale and skew a selection or multi-selection.

How to animate using the Transform tool

1. In the Tools toolbar, click the Transform  tool or press Shift + T.
2. In the Transform Tool Properties view, make sure the Peg Selection  mode is deselected.
3. In the Timeline view, go to the frame on which you want to set the first position.
4. In the Timeline toolbar, click the Add Keyframe  button or press F6. It is recommended to add a keyframe before moving the character. Moving a character's part without setting a keyframe will create keyframes only on certain parameters of the animation. You could run into issues later on when setting poses between existing ones. Creating a keyframe on all layers and parameters will ensure your pose is set and will not be modified by other poses later on.
5. In the Camera view, select the element to animate and move it.

6. In the Timeline view, go to the frame where you want to set the next position.

7. In the Timeline toolbar, click the Add Keyframe  button or press F6.
8. In the Camera view, animate the character.

Resetting Transformations

With the Reset command, you can return a selected element to its initial position and scale values, depending on which tool is active. For example, if the Rotate  tool is active, the transformation angle will be reset to 0 and if the Transform  tool is active, then all transformation values will be reset.

The Reset All option Resets all transformations on the current frame in a selected layer. Your keyframe will remain, but all the values will return to the starting value. All transformations are reset regardless of the tool you're using.

The Reset All Except Z option resets Resets all transformations on the current frame except the Z position. This is useful when doing cut-out animation. Cut-out puppets often have a particular Z ordering for the different views of a character. You might want to reset the transformation, but not necessarily the Z position.

NOTE: When using the Transform tool to select elements in the Camera view, always make sure the Peg Selection Mode option in the Tool Properties view is disabled or it will limit the selection to peg only.

How to reset the transformation on the current frame

1. In the Tools toolbar, select the Transform  tool or any Advanced Animation  tool.
2. In the Timeline view or directly in the Camera view, select the drawing layer(s) to reset.
3. From the top menu, select **Animation > Reset** or press R. This will reset the current frame if keyframes were created.

The selected layer(s) return to their original position.

How to reset all transformations on the current frame

1. In the Tools toolbar, select the Transform  tool or any Advanced Animation  tool.
2. In the Timeline view or directly in the Camera view, select the drawing layer(s) to reset.
3. From the top menu, select **Animation > Reset All** or press Shift + R.

The selected layer(s) return to their original position.

How to reset all transformation values except Z

1. In the Tools toolbar, select the Transform  tool or any Advanced Animation  tool.
2. In the Timeline view or directly in the Camera view, select the drawing layer(s) to reset.
3. From the top menu, select **Animation > Reset All Except Z**.

All values except for those set on the Z axis are reset.

How to completely reset the layers' parameters

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. In the Timeline or Camera view, select one or more drawing layers to reset.
3. Do one of the following:
 - Right-click the selected layers and select **Clear All Values**. This will remove all keyframes and reset all values for the entire layer.
 - In the Timeline View menu, select **Layers > Clear All Values**. This will remove all keyframes and reset all values for the entire layer.

The selected layers return to their original position.

About Hierarchy Navigation

If there is a layer hierarchy in the puppet you built, use the keyboard shortcuts to travel up and down the parent-child chain. You can navigate between the children of the same parent. You can also easily center on your selection in the Timeline view.

Navigating Layers

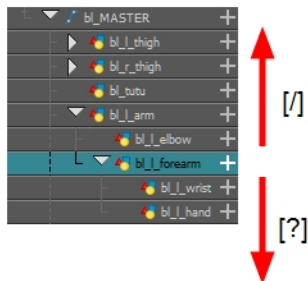

Navigate between the layers in the Timeline view, using keyboard shortcuts or the Animation menu. This way of navigating only works for unparented layers or the children of a parent layer. If you are navigating between unparented layers, parent layers can be selected, but their children will be skipped. If you start on a parented layer (child), only the other children of the same parent will be available for selection.

How move up and down the layer stack

1. In the Tools toolbar, select the Transform  tool.
2. In the Camera or Timeline view, select an unparented layer or child layer of a parent with several children.

3. From the top menu, select:
 - **Animation > Select Previous Sibling** or press `/` to select the previous child layer.
 - **Animation Select Next Sibling** or press `?` to select the next child layer.

Selecting Parent and Children

When animating, large movements that are made at the root (parent) of a chain cause secondary movements throughout the rest (children) of the chain. For example, when you rotate the arm of a character from the shoulder, the forearm and hand will follow. However, in order to make the movement appear natural and graceful, the forearm and hand should not move at the same speed or angle. As a result, animators often need to move up and down a chain, intermittently selecting parent and children, in order to make both large and fine movements.

How to select the parent or child of the selected layer

1. In the Tools toolbar, select the Transform  tool.
2. In the Transform Tool Properties view, make sure the Peg Selection  mode is deselected.
3. In the Camera or Timeline view, select a layer or object attached to a hierarchy.

4. From the top menu, select **Animation > Select Parent** or press B to select the parent layer. Select **Animation > Select Child** or press Shift + B to select the child layer or **Animation > Select Children** to select all child layers at the same time.

Centering on Selections

When you have many layers in the Timeline view, you may find it hard to locate which one is selected. You can use the Centre on Selection feature to display the selected object's layer in the Timeline view.

How to center on the selected layer in the Timeline view

1. In the Camera view, select a layer.
2. Do one of the following:
 - From the Timeline view menu, select **View > Centre on Selection** or press O.
 - In the Timeline view toolbar, click the Centre on Selection  button.

About Keyframes

Keyframes are the building blocks of Cut-out animation. Unlike Traditional animation, where every pose is drawn, Cut-out animation uses keyframes to mark major poses (key poses) and lets the software create all the poses in between.

In Harmony, you can create two kinds of keyframes: Motion and Stop-Motion. Motion keyframes behave like the description above; they allow for the automatic creation of drawings between two keyframed poses. Stop-Motion keyframes do not allow for interpolation between keyframes. They are often used to block poses, somewhat similar to what you would see in Traditional Animation.

Creating Motion Keyframes

After you have created the key poses, you can animate the in-between poses yourself or let Harmony do it using motion keyframes. When you use motion keyframes, the drawings gradually move to the next position instead of staying on the spot until the next keyframe.

How to create motion keyframes

1. In the top menu, make sure the **Animation > Stop-Motion Keyframe** option is disabled.
2. In the Timeline view, select the cell on which you want to add a keyframe.

3. Do one of the following:
 - Right-click on the selection and select **Insert Keyframe**.
 - Click the Add Keyframe **KF** button in the Timeline toolbar.
 - Press F6.
 - In the Camera view, if the Animate mode is enabled, as soon as you move the selected element, a keyframe will be automatically created on the current frame.

How to convert a stop-motion keyframe into a motion keyframe

1. In the Timeline view, select the stop-motion keyframes to convert into motion keyframes.

2. Do one of the following:

- Right-click on the selection and select **Set Motion Keyframe**.
- Click the Motion Keyframe  button in the Timeline View toolbar.
- Press Ctrl + K (Windows/Linux) or ⌘ + K (Mac OS X).

Creating Stop-motion Keyframes

To start animating your character, start by doing your key poses. In fact, most of your time will be spent doing key poses. It is better to work with stop-motion keyframes so Harmony does not automatically create the interpolation between your keyframes.

When using stop-motion keyframes, also known as *step keyframes*, the segment between two keyframes is constant. There is no animation generated by the computer between the poses. The drawing remains in position until the next keyframe, then moves to its new position.

How to create stop-motion keyframes

1. In the top menu, make sure the **Animation > Stop-motion Keyframe** option is selected.
2. In the Timeline view, select the cell on which you want to add a keyframe.

3. Do one of the following:
 - Right-click and select **Insert Keyframe**.
 - In the Timeline toolbar, click the Add Keyframe **KF** button.
 - Press F6.
 - In the Camera view, if the Animate mode is enabled, as soon as you move the selected element, a keyframe is automatically created on the current frame.

How to convert a motion keyframe into a stop-motion keyframe

1. In the Timeline view, select the motion keyframes to convert into stop-motion keyframes or press S.

2. Do one of the following:
 - Right-click and select **Set Stop-Motion Keyframes**.
 - In the Timeline toolbar, click the Stop-Motion Keyframe  button.
 - Press Ctrl + L (Windows/Linux) or ⌘ + L (Mac OS X).

About Swapping Drawings

T-RIG-004-001

Cut-out animation is not only about moving parts around. It's also about swapping drawings to give the animation a more traditional animation look. You can add as many new drawings as you want in your scene and use them in your current animation. You can also add new drawings to the library and use them in other scenes. But before starting to swap drawings, it's important to understand how keyframes, exposure and key exposure work in Harmony:

- **Keyframe:** A keyframe is a point in time where a change to the properties of the object or character occurs. In Harmony, keyframes consist of the coordinates that determine how an entire layer and its contents are moved. Keyframes include these parameters: XYZ position, skew, scale, angle and pivot.
- **Exposure:** Exposure is a property; it is the length of time that a drawing is visible over a series of frames. In Harmony, exposure is independent of keyframes. That is, keyframes are not linked to drawings. Keyframes can be moved independently from the drawing exposure.
- **Key Exposure:** A key exposure in Harmony is a type of exposure that forces a drawing to remain exposed on a specific frame. If a drawing is exposed before a key exposure and you swap out that drawing for another one, then the original drawing is retained. This preserves the key drawing. Note that Harmony automatically sets a key exposure when you perform a drawing swap.

When you want to swap drawings, you can do so in the Timeline or Library view. In the Timeline view, the Parameters area is where you can select a drawing to swap. In the Library view, the Drawing Substitution window lets you see the drawings before selecting one for swapping. In this view, you are actually selecting drawings in your scene layers, not drawings in the Library.

NOTE: Keep in mind that when you swap a drawing, its entire exposure is replaced up to the next drawing exposure.

Drawing exposure duration

Swapping Drawings in the Timeline View

When selecting a certain frame range to be swapped, the behaviour of the Timeline and Library views is different. If you are using the Parameters area of the Timeline view to select a drawing to replace a selected frame range, the new drawing will replace the frame range and continue until the next key exposure. In the following example, drawing 2 (DR2) is replaced by a new drawing, starting at the beginning of the selected frame range and ending at the next key exposure.

Selected frame range is replaced by a drawing selected from the Parameters area of the Timeline view. The exposure starts at the beginning of the frame range and continues until the next key exposure.

How to swap a drawing in the Timeline view

1. In the Timeline view's right side, select the cell containing the drawing or symbol cell to swap.

2. In the Drawing Substitution field, position the pointer over the value and drag left or right to change the cell or drawing exposed for another one. You can also type in the drawing name or symbol's cell number if you know it.

Drawing Substitution field

Swapping Drawings in the Library View

When selecting a certain frame range to be swapped, the behaviour of the Timeline and Library views is different. If you use the Drawing Substitution window in the Library view to select a drawing, the drawing is split in two and the exposure before and after the frame range remain the same. In the following example, drawing 2 (DR 2) is split in two and the selected frame range is filled with a new drawing.

Selected frame range is replaced by a drawing selected from the Library view. The drawing is split in two. The exposure remains the same before and after the new drawing.

How to swap images in the Library view

1. In the Tools toolbar, select the Transform  tool.
2. In the Transform Tool Properties view, make sure the Peg Selection  button is deselected.
3. In the Camera view, use the Transform  tool to select a part of the drawing to swap.

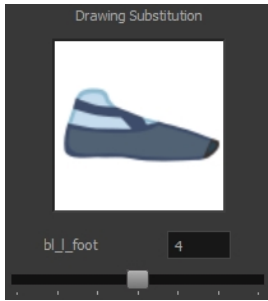

NOTE: You can swap the frames in symbols or the drawings in a layer. However, you cannot swap one symbol for another.

4. In the Timeline view, select the cell range in which you want to swap the drawing.

5. In the Library view, go to the Drawing Substitution window.

6. Scroll through the symbol's frames or drawings by doing one of the following:
- ▶ From the top menu, select **Animation > Substitute Drawing Previous** or **Substitute Drawing Next**.
 - ▶ Drag the slider left or right.
 - ▶ Press +.

The drawing or symbol's cell on the current frame is replaced.

Adding Key Exposures

If there is a particular drawing you want to keep on a specific frame, you can set it as a key exposure. This prevents it from being overwritten by a drawing swap on a preceding frame. A key exposure is simply a property of an exposure that forces it to be exposed on a certain frame regardless of whether the previous exposure is the same drawing or not.

NOTE: Keep in mind that if you modify the artwork in a drawing, all instances of that drawing will be automatically updated even if set as a key exposure. This keeps your existing animation key poses intact. It is frequently used on a mouth or eyes layer.

Example: Swapping a drawing with no key exposure

In the following example, drawing 3 (DR 3) is selected on the timeline and it contains no key exposure.

When it is swapped for drawing 4 (DR 4), the entire duration of drawing 3 substituted for drawing 4.

Example: Swapping a drawing with a key exposure

Here's what happens when swapping a drawing with a key exposure. In the following example, the playhead is positioned in the middle of drawing 5 (DR 5) to set the position for the new key exposure. When the new key exposure is added, drawing 5 is split in two; both halves contain drawing 5. Now if you swap the first drawing 5 for drawing 1, the second drawing 5 retains its exposure.

A location is selected for a new key exposure.

A key exposure is added at the location of the playhead.

One drawing is swapped for drawing 1 (DR 1). The second drawing retains its exposure.

How to add a key exposure

1. In the Timeline view, select the drawing cell to set as the key exposure.
2. Do one of the following: In the Timeline toolbar, click the Add Key Exposure  button.
 - ▶ In the Timeline toolbar, click the Add Key Exposure  button.
 - ▶ In the Timeline menu, select **Exposure > Add Key Exposure**.
 - ▶ Right-click and select **Exposure > Add Key Exposure**.

A new key exposure is added.

If you added a key exposure at the beginning of the drawing, the entire exposure is filled with that same drawing. If you added a key exposure anywhere other than the beginning of the drawing, then the drawing is split in two and both parts contain the same drawing.

Removing Key Exposures

When you no longer need a key exposure, you can remove it. When you do this, the existing key exposure is replaced by the preceding exposure. In the following example, a key exposure is set to drawing 1 (DR 1). When the key exposure is removed, the exposure is replaced by the preceding exposure, drawing 4 (DR 4).

Before: Key exposure is set to drawing 1.

After: Key exposure is removed. The preceding exposure, drawing 4, replaces the exposure.

How to remove a key exposure

1. In the Timeline view, select a key exposure to remove.
2. Do one of the following:
 - In the Timeline toolbar, click the Remove Key Exposure  button.
 - In the Timeline menu, select **Exposure > Remove Key Exposure**.
 - Right-click and select **Exposure > Remove Key Exposure**.

The key exposure is removed and replaced by the preceding exposure.

About Eases

To add ease in and ease out on motion paths, you can display the function curve and modify the Bezier or Ease curve. To apply an ease to multiple functions and keyframes, use the Set Ease for Multiple Parameters feature and set the amount desired.

The velocity, or ease, is used on motion keyframes. The velocity must be adjusted directly on the function curve in the Function view or Function editor. When a keyframe is selected, easing values appear in the right handle and left handle fields, as well as the Bezier handle or Ease wheel controls on each selected keyframe. You can pull on them to adjust the ease in and ease out, or type values in the fields.

If there are several functions whose velocity you want to adjust at the same time, such as the hand, forearm and arm of a cut-out character, you can apply the same velocity parameters to all the selected keyframes in one frame.

Setting Eases for Multiple Parameters

You can adjust eases for multiple parameters at once.

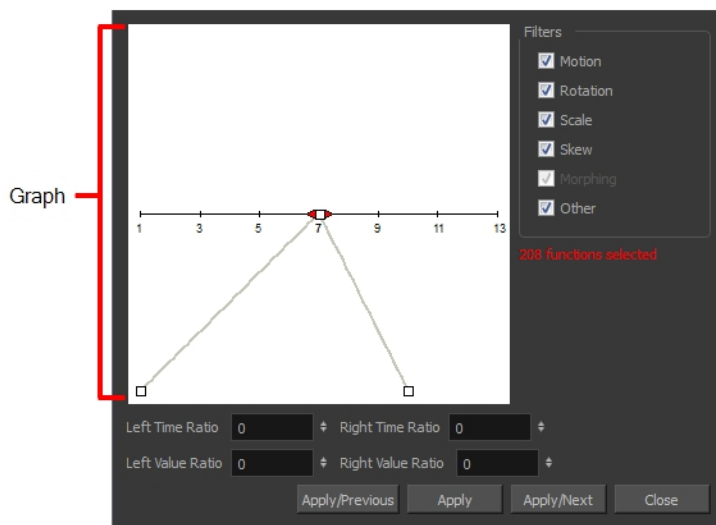

How to set ease on multiple parameters

1. In the Timeline view, collapse your character model's hierarchy.
2. Select one of your animation keyframes. Since your model's hierarchy is collapsed, this selects the key-frame on every layer simultaneously.

3. Do one of the following:
 - In the Timeline view, right-click and select **Set Ease For Multiple Parameters**.
 - In the Timeline toolbar, you can click the Set Ease For Multiple Parameters  button.

The Set Ease For Multiple Parameters dialog box opens.

4. In the graph, pull on the Bezier handle to adjust the velocity for all the selected functions.

5. To apply these easing parameters to a certain type of function only, such as Rotation or Scale, in the Filters section, deselect the function types you do not want to affect.
 - **Motion:** Applies the easing parameters to the selected Position X, Position Y, Position Z and 3D Path functions
 - **Rotation:** Applies the easing parameters to the selected Angle functions.
 - **Scale:** Applies the easing parameters to the selected Scale functions.
 - **Skew:** Applies the easing parameters to the selected Skew functions.
 - **Morphing:** Applies the easing parameters to the selected Morphing Velocity functions. Note that it is applied to the Morphing Velocity function in the Layer Properties window, not to the basic Morphing ease in the Tool Properties view.
 - **Other:** Applies the easing parameters to all the other selected functions, such as all functions created to animate effect parameters.

6. You can also adjust the easing by typing values in the Time Ratio and Value Ratio fields. The values are calculated in percentage.
 - In the Left Time Ratio and Right Time Ratio fields, type the percentage value corresponding to the length of time you want the easing to last. The value must be between 0% and 100%.
 - In the Left Value Ratio and Right Value Ratio fields, type the percentage value of how strong you want the easing out. The value must be between 0% and 100%.
 - If your Time Ratio and Value Ratio values are equal, you will have a linear motion.

7. Click one of the following buttons:
 - **Apply:** Applies the easing parameters to the selected keyframes.
 - **Apply/Previous:** Applies the easing parameters to the selected keyframes and then selects the previous keyframe in the timeline.
 - **Apply/Next:** Applies the easing parameters to the selected keyframes and then selects the next keyframe in the timeline.
 - **Close:** Closes the dialog box. If you did not apply the modifications, they will be cancelled.

NOTE: If a range containing multiple keyframes is selected, only the first selected keyframe will be affected by the Seat Ease for Multiple Parameters functionality.

Using the Onion Skin in Cut-out Animation

When animating cut-out characters, it is useful to see the previous and next frames on the animation. However, it can sometimes be confusing to see the onion skin for every part of the character. You will often only want to see the onion skin on a single part or a few parts, such as the arm that is currently being animated.

While animating in the Camera view, there is a series of different onion skin options. You can enable these options in the menu or manually in the Timeline view using the layer's Show Onion Skin  button. Only selected layers will be displayed in the onion skin preview; you can change the display options when you use the onion skin.

How to use the onion skin

1. In the Tools toolbar, click the Onion Skin  button or press Alt + O.
2. In the Tools toolbar, click the Transform  tool or press Shift + T.
3. In the Camera view, select one or more elements.
4. Select **View > Onion Skin** and one of the following commands:
 - **Add to Onion Skin:** Adds a series of selected elements to the onion skin preview.
 - **Remove From Onion Skin:** Removes a series of selected elements from the onion skin preview.
 - **Remove Unselected from Onion Skin:** Removes all elements except the ones selected from the onion skin preview.
 - **Add All to Onion Skin:** Adds all of the scene's elements to the onion skin preview.
 - **Remove All from Onion Skin:** Removes all of the scene's elements from the onion skin preview.

Add to Onion Skin

The Add to Onion Skin command adds a series of selected elements to the onion skin preview. The keyboard shortcut is Shift + S.

Remove from Onion Skin

The Remove From Onion Skin command removes a series of selected elements from the onion skin preview.

Remove Unselected from Onion Skin

The Remove Unselected from Onion Skin command removes all elements except the ones selected from the onion skin preview.

Add All to Onion Skin

The Add All to Onion Skin command adds all scene elements to the onion skin preview. The keyboard shortcut is Alt + Shift + O.

Remove All from Onion Skin

The Remove All Onion Skin command removes all scene elements from the onion skin preview. The keyboard shortcut is Ctrl + Shift + O (Windows/Linux) or ⌘ + Shift + O (Mac OS X).

Using the Outline Mode

Use the Outline mode to temporarily convert all the drawings on a layer to outlines. You can still select and manipulate the drawings in this mode. Select a drawing by selecting its outline. The fill is not taken into account when making selections in this mode.

Toggling drawings to outlines

1. In the Timeline view, click once on the Change Track Colour button of a layer to toggle all drawings of that layer to outlines, in the Camera view.

Change Track Colour

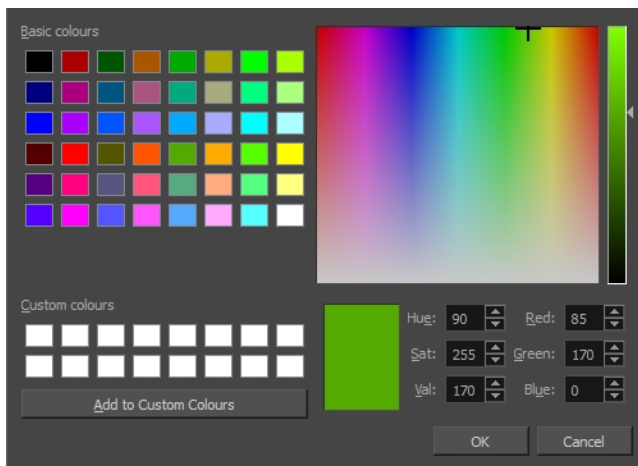

Changing the outline colour

1. In the Timeline view, double-click on the Change Track Colour button of a layer to open the Select Colour dialog box.

Change Track Colour

2. In the Select Colour window, select a new colour for your outlines.

3. Click Ok.

Change Track Colour

The colour swatch and frames of the selected layer take on the new colour.

4. In the Timeline view, click once on the change track colour of a layer to toggle all drawings of that layer to outlines, in the Camera view.

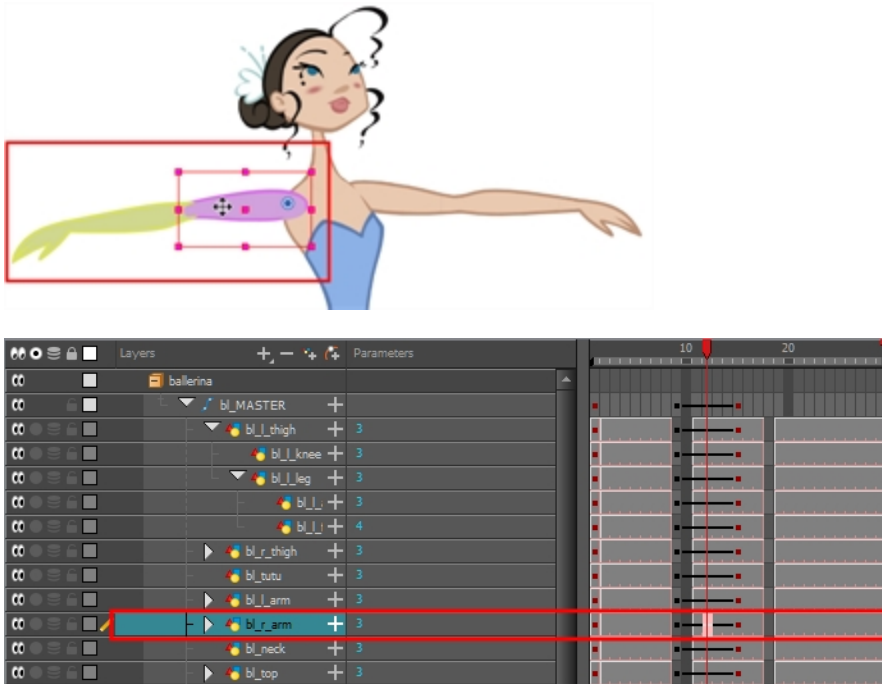

The outlines of the layer's drawings appear in the selected colour.

Flipping Through Poses

When animating, it is useful to flip through poses to see the flow of your animation without going through each frame in the Timeline view. Harmony lets you flip between the selected element's keyframes.

How to flip through poses

1. In the Camera or Timeline view, select a layer that contains the poses you want to view.

2. Do one of the following:
 - From the top menu, select **Animation > Go to Previous Keyframe** or **Go to Next Keyframe**
 - Press semicolon (;) and single quote (').

Flipping Parts

If you want to flip a part, a limb or a whole puppet, use the Transform tool and the Flip Horizontal and Flip Vertical options. If the Scaling parameter is not set to Separate Scale, the flip is not applied to the selection.

How to flip a selection

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. In the Tool Properties view, make sure the Peg Selection Mode  is disabled.
3. In the Camera view, select the parts to be flipped.

4. In the Tool Properties view, click the Flip Horizontal  or Flip Vertical  option or press 4 or 5 respectively.

Animating Lip-Sync

Adding a lip-sync to your animation is essential to making your characters seem alive. However, it is also a particularly tedious part of the animation process.

To solve this problem, Harmony provides an automatic lip-sync detection feature. This feature analyzes the content of a sound track in your scene and associates each phoneme it detects with one of the mouth shapes in the following mouth chart, which is a standard mouth chart in the animation industry.

NOTE: The letters assigned to these mouth shapes are standard identifiers, they **NOT** correspond to the sound they are meant to produce.

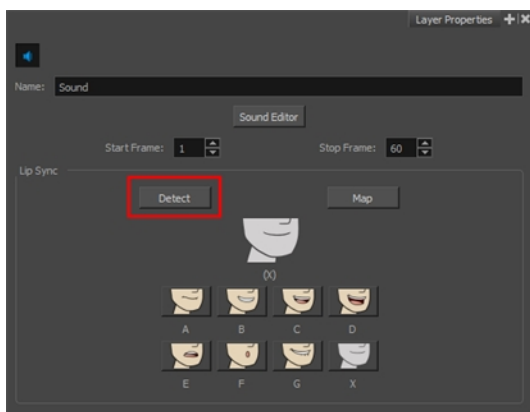

This is an approximation of the English phonemes each mouth shape can be used to represent:

- **A:** m, b, p, h
- **B:** s, d, j, i, k, t
- **C:** e, a
- **D:** A, E
- **E:** o
- **F:** u, oo
- **G:** f, ph
- **X:** Silence, undetermined sound

When performing automatic lip-sync detection, Harmony does not create mouth drawings. It simply fills the drawing column of your character's mouth layer with the generated lip-sync, by inserting the letter associated with the right mouth shape into each cell of the column. Therefore, for the automatic lip-sync detection to work, your character's mouth layer should already contain a mouth drawing for each drawing in the mouth chart, and these drawings should be named by their corresponding letter.

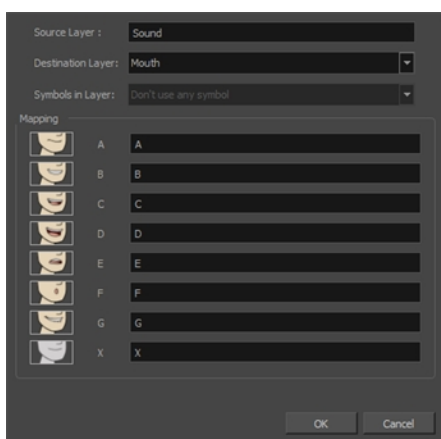

How to generate a sound detection for lip-sync using the Layer Properties view

1. In the Timeline or Xsheet view, select the sound layer.
The options for that layer will appear in the Layer Properties view.
2. In the Layer Properties, click **Detect**.

A progress bar appears while Harmony analyzes the selected sound clips and assigns a lip-sync letter to each sound cell.

3. Click the **Map** button to open the Lip-Sync Mapping dialog box.

4. From the Destination Layer menu, select the layer that contains the mouth positions for the character's voice track.

5. If the selected layer contains symbols, you can map the lip-sync using drawings located directly on the layer or use the symbol's frames. In the Symbol Layer field select **Don't Use Any Symbol** if you want to use the drawings or select the desired symbol from the drop-down menu.
6. In the Mapping section, type the drawing name or Symbol frames in the field to the right of the phoneme it represents. If your drawings are already named with the phoneme letters, you do not have to do anything.
7. Click **OK**.
8. In the Playback toolbar, enable the Enable Sound 🔊 option.
9. Press the Play ▶ button in the Playback toolbar to see and hear the results in the Camera view

You can manually create the lip-syncing for your scene by selecting which mouth drawing should be exposed at each frame of your character's dialogue. For this process, you will be using the Sound Scrubbing functionality, which plays the part of your sound track at the current frame whenever you move your Timeline cursor, allowing you to identify which phonemes you should match your character's mouth to. You will also be using drawing substitution to change which mouth drawing is exposed at every frame.

How to animate lip-sync using the Timeline view

1. In the Playback toolbar, enable the **Sound Scrubbing** 🔊 button.
2. In the Timeline view, drag the red playhead along the sound layer waveform.
3. When you reach a frame where a mouth position should go, for example, an open mouth with rounded lips for an "oh" sound, click on that frame on your mouth shapes layer.
4. In the Parameters section, staying on your mouth shapes layer, place your cursor on top of the drawing name (often a letter) until it changes to the swapping 🔄 pointer.
5. Pull the cursor to see the list of mouth shape names and choose the one you want. The current drawing automatically changes to the new selection.

How to animate lip-sync using the Library view

1. In the Playback toolbar, click the Sound Scrubbing 🔊 button.
2. In the Timeline view, drag the red playhead along the waveform of your sound layer.
3. When you reach a frame where a mouth position should go, for example, an open mouth with rounded lips for an "oh" sound, click on that frame on your mouth shapes layer.
4. In the Drawing Substitution window of the Library view, drag the slider to choose a mouth shape. The current drawing is swapped for the one in the preview window.

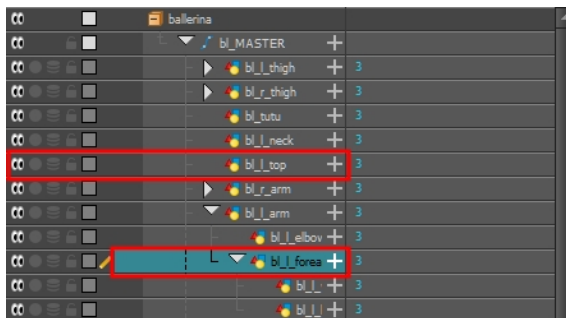

Ordering in Z-Depth

The layer ordering system in Harmony saves time and simplifies your work. There is no need to create a new layer or copy and paste artwork into other layers to change the order. The Z-axis (forward/backward) allows you to create a multiplane and move elements closer or farther from the camera. This allows you to move the puppet's pieces in front of or behind other ones without physically changing the layer position.

Harmony provides you with a shortcut to move the piece with a micro nudge on the Z-axis. A keyframe is created where different Z values can be entered. This allows the piece to move forward and backwards in space without requiring you to change the drawing's original position or break the layer hierarchy. This also means that the layer ordering is maintained throughout the scene. You can combine animation assets so Harmony can interpolate them.

How to nudge elements on the Z-axis

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. In the Tools toolbar, click the Animate  button.
3. In the Camera view, select the part to be repositioned and hold down the Alt key.
4. Using the Up Arrow or Down Arrow arrow keys, nudge the part until it moves to the desired position.

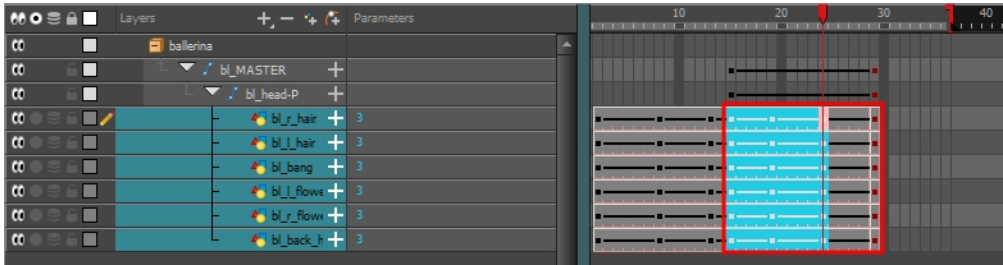

Creating Cycles

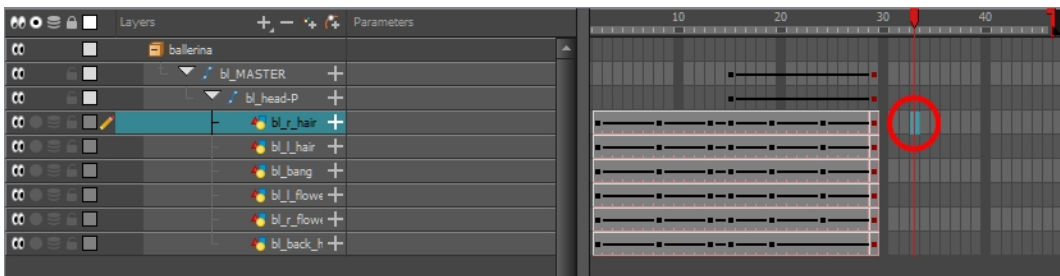

You can create cycles from a portion of your animation or completely reverse the flow of your animation.

How to create an animation cycle

1. In the Xsheet or Timeline view, select the cell range and keyframes to loop.

2. From the top menu, select **Edit > Copy Cells From the Timeline**.
3. In the Xsheet or Timeline view, select the cell where you want your cycles to start.

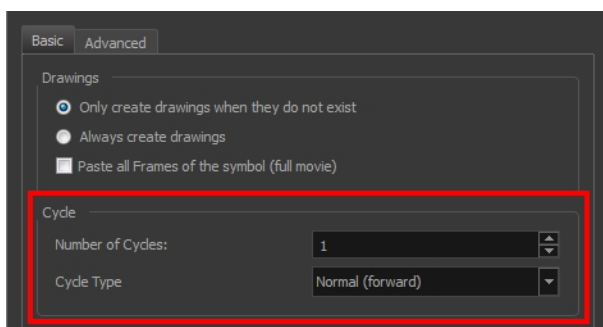

4. From the top menu, select one of the following:
 - **Edit > Paste Cycle** or press **Ctrl + /** (Windows/Linux) or **⌘ + /** (Mac OS X).

The Paste Special dialog box opens.

- **Edit > Paste Special** or press **Ctrl + B** (Windows/Linux) or **⌘ + B** (Mac OS X).

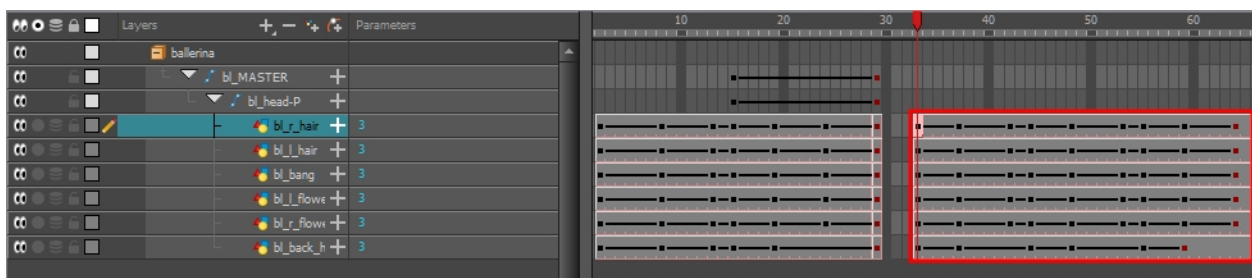

The Paste Special dialog box opens.

2. In the Number of Cycles field, enter the number of cycles to paste.
3. In the Cycle Type menu, select a type of cycle to paste.

- **Normal (forward)**: Pastes the selection as is, starting with the first cell and ending with the last.
 - **Reverse**: Pastes the selection reversed, beginning with the last cell and ending with the first.
 - **Forward -> Reverse**: Pastes the selection as a yo-yo, starting with the first cell, going to the last cell and ending with the first cell.
 - **Reverse -> Forward**: Pastes the selection as a reversed yo-yo, starting with the last cell, going to the first one and ending with the last cell.
5. Click **OK**.

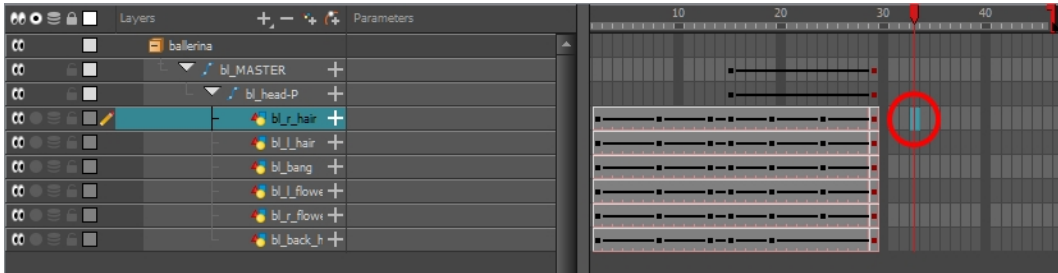

How to create a reverse animation cycle

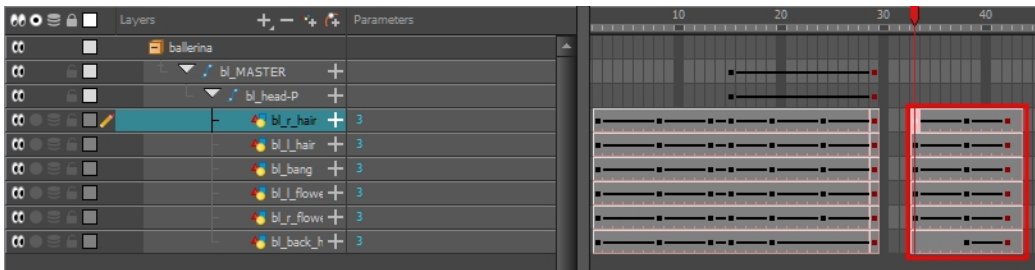

1. In the Xsheet or Timeline view, select the cell range and keyframes to paste inverted.

2. From the top menu, select **Edit > Copy**.
3. In the Xsheet or Timeline view, select the cell where you want the cycles to start.

4. From the top menu, select **Edit > Paste Reverse** or press **Ctrl + .** (Windows/Linux) or **⌘ + .** (Mac OS X).

About Timeline Marking

As you animate, the Timeline view will accumulate many layers and keyframes. You might want to identify them using coloured layers and scene markers.

Scene markers are visual indicators displayed at the top of the Timeline view in the frame counter area. You can use it to denote anything relevant to your work. You can indicate the frames you want to clean up, a change in action, an impact, or where you intend to apply an effect. You can also add a note to a scene marker, which is displayed when you hover over the scene marker.

There are two ways to add a scene marker. You can mark the current frame or make a frame range selection and mark the whole section.

To see how to mark the Timeline, see [Marking the Current Frame](#), [Marking Frame Ranges](#), [Marking Layers with Colour](#)

Marking the Current Frame

Sometimes you need a single frame or specific frames to stand out. You can do this by changing the colour just above the frame, in the frame counter area.

How to mark the current frame

1. In the Timeline view, make sure the red playhead is set on the frame you want to mark. Even if you right-click on a different frame, the scene marker will be created on the current frame on which the playhead is positioned.
2. Right-click in the frame counter area and select **Scene Markers > Mark Current Frame**.

The Timeline Scene Marker dialog box opens. The Colour box displays a black colour swatch, or the colour of the last scene marker you created.

3. Click the Colour swatch to open the Marker Colour dialog box and select a colour for the scene marker. Click **OK**.

4. In the Note field, enter descriptive or title text and click **OK**. This text will appear in the tooltip when you hover your mouse over the scene marker.

In the Timeline view, the scene marker is displayed at the current frame.

5. Hover over the scene marker to display its tooltip.

Marking Frame Ranges

Sometimes you need a range of frames to stand out. You can do this by changing the colour just above the range, in the frame counter area.

How to create a scene marker on a frame range

1. In the frame counter area, select the frame range you want to mark.

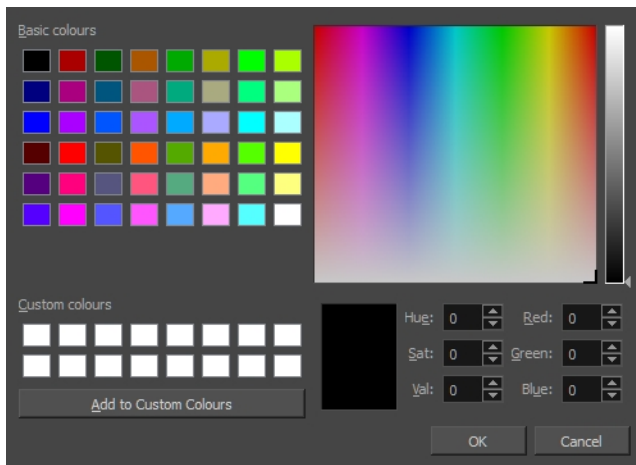

2. Right-click and select **Create Scene Marker**.

The Timeline Scene Marker dialog box opens. The Colour box displays a black colour swatch, or the colour of the last scene marker you created.

3. Click the Colour swatch to open the Marker Colour dialog box and select a colour for the scene marker. Click **OK**.

4. In the Note field, enter descriptive or title text and click **OK**. This text will appear in the tooltip when you hover your mouse over the scene marker.

In the Timeline view, the scene marker is displayed over the selected frame counters.

5. Hover over the scene marker to display its tooltip.

Marking Layers with Colour

As you animate, you may want to differentiate between different types of layers, such as pegs and drawing layers, or simply highlight a layer you are currently working on. You can organize layers or make them stand out by changing the layer colour.

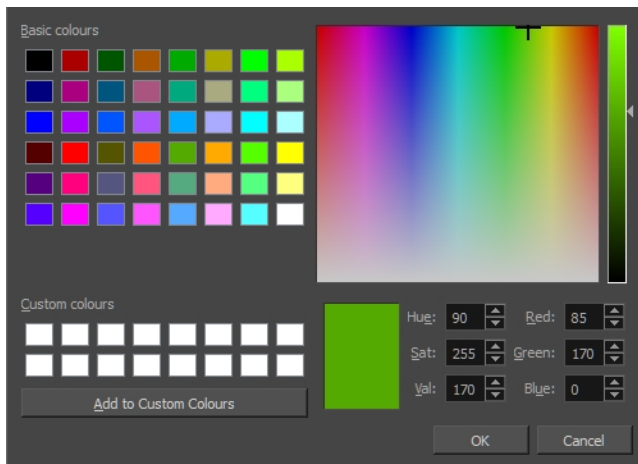

How to mark a layer with colour

1. Click the Change Track Colour button of a layer.

Change Track Colour

The Select Colour dialog box opens.

2. Select a colour for the layer. You can modify the colour for any type of layer, such as group, peg, drawing and effects.

Change Track Colour

Chapter 13: Morphing

Hand-drawn animation requires you to spend a lot of time tracing in-between drawings. Harmony's morphing feature can help speed up the process. This powerful feature automatically creates computer-generated drawings between your vector drawings to save time and increase productivity. You can easily modify the timing and velocity (ease in and ease out) of a morphing animation.

One of the main uses of the morphing feature is effects animation. For example, animating smoke or water can be time-consuming because these types of effects are usually slow moving requiring a large number of closely placed inbetweens.

The morphing feature is used to animate similar and simple shapes such as hair or smoke. It helps you by saving time when you are working on tedious inbetweening and tracing tasks. This, in turn, provides you with more time to spend on complex animation tasks such as walk cycles or acrobatic sequences.

To learn how to morph drawings, it is better to start with basic shapes such as circles and rectangles. Once you are more familiar with the tool, you can increase your knowledge and expertise. In a very short time you will be producing some remarkable effects.

It is helpful to know the pros and cons of morphing before you start. Understanding what you can do and which drawing lines may be more useful or problematic will enable you to design your key drawings so they morph efficiently.

NOTE: The more complex the shape is, the longer it takes to morph. If it takes more time to morph a drawing than to hand-draw it, then it is better to animate it instead of morphing. However, if you spot an occasion when you can morph your drawings, do it! It allows you to fix your timing and velocity in no time without having to create any extra drawings!

About Source and Destination Drawings

The morphing feature matches similar shapes in a source and a destination drawing. Harmony evaluates the source's shape properties and matches them to the most similar ones in the destination drawing.

Morphing works between similar shapes, which are drawings that have the same palette, colours and number of shapes. You can even change any shape into another one, as long as the source and destination keep the same colours, number of lines and number of shapes.

About Morphing Rules

Harmony follows a set of rules as it evaluates the shapes. Familiarize yourself with these basic morphing rules before you start morphing.

NOTE: Note that a morphing sequence can only be done on vector drawings. You cannot morph bitmap layers or Toon Boom bitmap drawings.

Here are a few tips about creating morphing sequences:

- When learning about morphing, it is recommended that you use the Brush tool. You can use the Pencil line for simple closed shapes.
- If you are using pencil lines, use Contour hints instead of Pencil hints. Use Pencil hint if you want the Pencil line to switch direction.
- Flatten your drawing before starting a morphing sequence.
- If you leave a dot, even the smallest one, it is possible that your morphing will create odd shapes. If the source line is closer to the dot than the destination line, the source line will morph into the dot and the destination line will disappear.
- Use the same colour swatch between two drawings. You cannot morph between two different colour swatches even if they have the same RGB values. This can be turned to your advantage for complex morphing.
- Similar shapes should have the same number of colour zones. This only applies to the number of zones and lines and not the number of points on a curve.
- If a zone inside a larger zone on the source drawing ends up outside on the destination drawing, the morphing will fail.
- For example, if you are morphing a face so it turns from the front to the side, the nose is located in the middle of the face on the source drawing. However if after morphing, the nose ends up outside or merged with the face profile line on the destination drawing, this will give undesirable results. You can avoid this by using morphing layers and splitting the nose on a separate layer.

About the Closest Similar Shape Rule

A colour, line shape or zone will morph with the closest similar one in the destination drawing. This means it will morph with the zone nearest to it, as long as that zone uses the same palette's colour swatch (colour ID) and has the same vector properties (Central or Contour).

In the example above, the red heart shape (1) will morph with the closest shape using the same colour swatch. It will morph with the red diamond shape (1) in the next drawing. The red diamond shape (2) in the source drawing will morph with the red heart shape (2) located in the same area in the destination drawing. The black spade shape (3) in the source drawing will morph with the black club shape (3) located in the same area in the destination drawing. Finally, the black club shape (4) in the source drawing will morph into the black spade shape (4) located above in the destination drawing.

About the Pencil Line to Pencil Line Rule

If you trace a shape using a pencil line such as the Ellipse , Rectangle , Polyline , Line  or Pencil  tool, you have to morph it with another pencil line. Make sure that both drawings are pencil shapes (central vector).

A pencil line will never morph with a brush stroke.

Pencil lines with thickness are supported in morphing sequences. The thickness will morph according to the thickest and thinnest areas in the source and destination drawings.

Pencil lines with textures are not supported in a morphing sequence. During the morphing, the texture will disappear and show without pencil line opacity texture.

If you have pencil lines in your source drawing, the same number of pencil lines must be present in the destination drawings. A pencil line will appear if it is not found in the destination drawing. It will pop out on the first or last frame depending on which one it is drawn.

When two pencil lines cross one another, they are considered to be two lines and not four lines anymore (as it was in version 7.8 and below of the application). In this case, you must have two pencil lines in your destination drawing for your morphing to work correctly.

About the Fill Shape to Fill Shape Rule

If you have a brush stroke or a colour fill (contour vectors), make sure that you morph it with another brush stroke or fill zone. It is important to understand that strokes drawn with the Brush tool are the same thing as zones painted with the Paint tool. Vector points are located along the contour. They are simply not the same size. Contour vectors will not morph with pencil lines (central vectors). A brush stroke can morph into a colour fill zone and vice versa as they are the exact same thing.

About the Same Colour Swatch Rule

Harmony does not morph between colours. If you want to perform a colour transition, you have to create the effect during the compositing step of your production. A colour palette is composed of colour swatches. Each colour swatch has its own unique identification number, even if two swatches are the same colour value, they are identified independently. A colour zone or shape will morph with another one painted with the same colour swatch.

About the Vanishing and Appearing Rule

If a colour zone does not find a match in the first or the second drawing, it will progressively appear or disappear.

About the Colour Art and Line Art Rule

In Harmony, there is an advanced concept for painting your drawings called Line Art and Colour Art. Basically, an extra layer is added in your drawings so that you can fill the colour zones on a separate layer. The regular layer on which you are drawing is called Line Art and the extra layer under the Line Art is the Colour Art.

- A shape drawn in Colour Art can only be morphed with another shape existing in the Colour Art.
- A shape drawn in Line Art can only be morphed with another shape existing in the Line Art.
- A shape created in Colour Art can never morph with a shape created in Line Art.

Creating Morphing

When it comes to morphing, you will need to practice and become at ease with it. Once you are familiar with the basic rules, you can start creating morphing sequences. To begin, start with simple elements. When you are confident with the morphing process, you can start to use complex and advanced morphing techniques, such as head rotations or full characters.

NOTE: As you create and adjust your morphing sequences, you will often use the Tool Properties view. Using this view allows you to do things such as toggle between your key drawings, adjust the easing or select a hint type.

How to create a basic morph

1. In the Timeline toolbar, click the Add Drawing Layer  button to add a new layer to your project.
2. Rename the new layer (for example, **Morphing**).
3. In the Timeline or Xsheet view, select the first cell in the layer.

4. Do one of the following:
 - In the Tools toolbar, select the Rectangle  tool.
 - Press Alt + 7.
5. In the Camera or Drawing view, draw a rectangle.

NOTE: When drawing a rectangle or an ellipsis, you can hold down the Shift key to draw your shape with equal dimensions, so as to make a square or a circle instead. You can also hold down the Alt key to draw the shape from its center rather than from its corner.

6. Paint your rectangle using the Paint tool.

7. In the Xsheet or Timeline view, select the cell on which you want your morphing sequence to end.

8. Do one of the following:

- In the Tools toolbar, select the Ellipse  tool.
- Press Alt + =.

9. Draw and paint the ellipse with the same outline and fill colours as the rectangle.

10. In the Xsheet or Timeline view, select the range of frame going from your first drawing to your second drawing, including the frames containing the drawings.

11. Do one of the following:

- From the top menu, select **Animation > Morphing > Create Morphing**.
- In the Xsheet or Timeline view, right-click and select **Morphing > Create Morphing**

- Press Alt + M.

Arrows appear between the two key drawings to show that computer generated inbetweens have been created.

Deleting Morphing

You may want to delete an entire morphing sequence in order to redo a sequence from scratch.

How to delete a morphing sequence

1. In the Xsheet or Timeline view, select a cell in the morphing sequence.
2. Do one of the following:
 - From the top menu, select **Animation > Morphing > Delete Morphing**.
 - From the Xsheet or Timeline view menu, select **Morphing > Delete Morphing**.
 - Right-click on your sequence and select **Morphing > Delete Morphing**.

The entire sequence between the two keyframes is removed.

About Morphing Velocity and Timing

Once you have set up a morphing sequence, you can control its velocity and timing.

When you look at your animation you will notice that the morphing motion is constant. To produce a less mechanical motion, you will probably want to create some ease in or ease out.

If you have several morphing sequences on a single layer, you may find it easier to adjust their velocities on one function curve rather than several separate ones. Having all of your velocity parameters in one place is more efficient and easier to modify.

Adjusting the velocity in the Layer Properties editor also allows you to reverse a section of the morphing sequence. The sequence will always start with the source drawing and end at the destination. You can play the morphing sequence backwards or forwards during the animation.

Adjusting the Morphing Velocity

You can have two levels of easing:

- In the Tool Properties View, you can adjust the velocity of each sequence in your layer independently
- In the Layer Properties editor, you can adjust the morphing velocity function to control the entire layer's easing

How to adjust the velocity in the Tool Properties view

1. In the Tools toolbar, select the Morphing  tool or press F3.
2. In the Timeline view, click on a frame in the morphing sequence you want to adjust.
3. In the Tool Properties view, increase and decrease the Ease In and Ease Out value to adjust the sequence's velocity.

Adjusting the Morphing Timing

If you did not place your source and destination drawings on the correct frames you may need to extend or shrink the sequence length.

How to extend or shrink a morphing sequence length

1. In the Timeline view, select the source or destination drawing.
2. Click on your selection and drag the drawing to its new frame.

About Morphing Hints

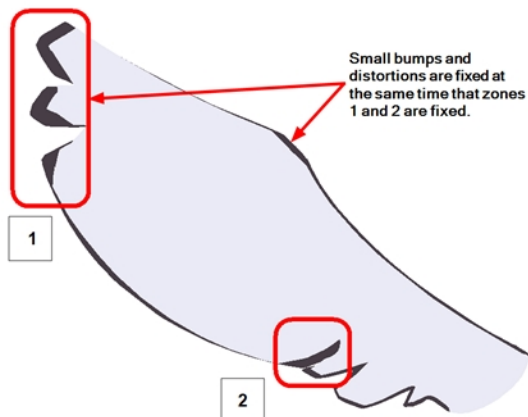

Harmony's Morphing tool allows you to control your morphing sequence in many ways. One of those ways is to place hints to ensure Harmony morphs your drawings the way you intended.

Hints are points that are placed in both the source and destination drawings to associate zones and lines between the two drawings. They are used to fix errors in the way Harmony morphs drawings, such as a line that is not following the colour fill zone, or when a part of your source drawing doesn't morph into its corresponding part of the destination drawing. By default, Harmony will associate a corner or a point in the source drawing with the nearest corner or point in the destination drawing. Hence, hints quickly become necessary if the shape being morphed or its movement is complex.

Hints always exist on both the source and destination drawing. When you create a hint on either drawing in a morph, a corresponding hint will automatically appear on the other drawing. The same principle applies if you delete a hint.

The key to placing your hints is to put them where the biggest problem is. Fix the largest distortions first, this may also fix the smaller ones at the same time.

Do not add too many hints, this is a common mistake when morphing, it takes some practice to learn how to correctly use and place hints.

If you are morphing two sequences in a row, you will have to create a different set of hint points for each sequence.

Morphing two sequences in a row requires three drawings: 1, 2 and 3. Using these three drawings you create two morphing sequences; one sequence between drawings 1 and 2, and a second sequence between drawings 2 and 3.

NOTE: Each morphing sequence has its own set of parameters and hints. This means that Drawing 2 will have a set of hints for the first sequence and another set for the second sequence. The two sets of hints will not show at the same time. Each set of hints that appears always corresponds to the morphing sequence you are working on.

About Hint Types

To correct morphing distortions, Harmony has different types of hints available for controlling different types of problems.

Each type of hint has a different purpose and they can all be used in the same drawing. Use the Morphing tool to add hints to your morphing sequences.

Hint points in the source drawing are green and red in the destination drawing.

About Contour Hints

The Contour Hint point is used on the colour fill zone and brush lines; in other words, on Contour vectors. It allows you to control the line thickness and contour position. Also, if a contour is not animated correctly, you can use hints to correct the animation. For example, if a flag is not waving properly.

When adding a Contour Hint point, make sure to place it far enough away from the contour so you can see it snap to the contour.

Contour Hint points are yellow.

NOTE: Do not place the Contour Hint directly on the line as it may look like it has snapped to the contour, when in fact, it has not and the morphing will remain unchanged.

NOTE: To correct a brush stroke, place a hint on both sides of the line to indicate its thickness variations over time.

About Zone Hints

The Zone Hint point is used on a colour zone to control the proximity rule. The Zone Hint is placed in the centre of the colour zone. Sometimes a colour zone is not associated with the corresponding one by default. For example, in a splash animation there are many water droplets that are the same colour. Harmony automatically morphs the droplet to the nearest one. This is not always the one you may have predicted. A Zone Hint will force a colour zone to morph with another one.

Zone Hint points are cyan in colour.

About Pencil Hints

A Pencil Hint point is used to control a pencil line, also known as *central vector*. It can be used on drawings that were done using the Pencil, Polyline, Ellipse, Line and Rectangle tools. Like the Contour Hint, the Pencil Hint snaps to the central vector. Make sure to place it far enough away from the line so you will see it snap when you move it.

Pencil Hint points are magenta in colour.

About Vanishing Point Hints

A Vanishing Point Hint is used to control the trajectory of a vanishing shape. A shape will vanish from the source drawing when there is no corresponding shape in the destination drawing. If you do not place a Vanishing Point Hint to control the point of disappearance, the shape will vanish into its centre.

Vanishing Point Hint points are green in colour.

About Appearing Point Hints

An Appearing Point Hint is used to control the trajectory of an appearing shape. A shape will appear in the destination drawing when there is no corresponding shape in the source drawing. If you do not place an Appearing Point Hint to control the point of appearance, the shape will appear from its centre and expand outwards.

Appearing Point Hint points are violet in colour.

Adding and Deleting Morphing Hints

Using the Morphing tool you can use hints to correct the morphing sequence.

How to add and hints

1. In the Timeline or Xsheet view, select the source drawing of your morphing sequence.
2. In the Tools toolbar, select the Morphing  tool or press F3.

Use your other morphing key drawing, shown in the Drawing view's bottom right corner, as a reference.

3. In the Tool Properties view, select the type of hint you want to use.

- Select Contour Hint to correct a brush line or colour zone's contour (Contour vector). Contour Hint points will behave similar to Pencil Hint points when used on a pencil line. Note that you obtain better results using the Pencil Hint point on pencil line rather than Contour Hint points.
 - Select Pencil Hint to correct a pencil line (Central vector).
 - Select Zone Hint to correct a colour zone morphing match.
 - Select Vanishing Point Hint to correct a vanishing shape's trajectory.
 - Select Appearing Point Hint to correct an appearing shape's trajectory.
4. In the Camera or Drawing view, click on the drawing near the problematic area.

5. Select the hint's point and move it to its correct position.

6. In the Timeline or Xsheet view, select your destination drawing.
7. Find and move the corresponding hint's point to the matching part of your destination drawing.

8. In the Playback toolbar, press the Play ► button to see the result.

How to delete hints

1. Select one or many hints.
2. Press Delete.

NOTE: To delete all of the hint points at once, press Shift + Delete.

Copying Hint Points

If you have two morphing sequences that use the same drawing and you would like to copy it and its hint points, you can do so in the Drawing view.

How to copy a drawing and its hints

1. Do one of the following:
 - In the Tools toolbar, click the Select  tool.
 - Press Alt + S.
2. In the Drawing view, select the drawing to reuse in your second morphing sequence.
3. Do one of the following:
 - In the top menu, select **Edit > Copy**.
 - Press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).

4. In the Timeline view, select the cell where the new drawing will be.

5. In the Drawing view, paste your selection.
6. Do one of the following:
 - In the top menu, select **Edit > Paste** .
 - Press **Ctrl + V** (Windows/Linux) or **⌘ + V** (Mac OS X).

7. In the Timeline view, select the cell where the second drawing will be.

8. In the Drawing or Camera view, draw your second drawing.

9. Do one of the following:
 - In the Timeline view, create the morphing sequence for the new drawings.
 - Press **Alt + M**.

10. Do one of the following:

- In the Tools toolbar, select the Morphing  tool.
- Press F3.

11. In the Drawing or Camera view, position your hint points.

About Morphing Layers

Morphing layers simplify the morphing animation. Complex shapes are often too difficult to control and may not work properly, by dividing the drawings into morphing layers, the task becomes much easier.

The major points used in controlling a morphing sequence are the intersections. If there are many lines intersecting within a drawing, the system will require more control—see [About Hint Types on page 808](#)

An important aspect of morphing is to identify possible problem zones in order to fix them and avoid potentially frustrating situations.

Simple details that look easy to morph can sometimes be more challenging than they may initially appear to be. For example, you may find that the nose becomes an issue when performing a head rotation. As explained earlier, the drawings need to be similar in their number of shapes. Generally, on a head rotation, the source nose is in the centre of the face, but on the destination, the nose line is part of the face outline. This means that on the source drawing, the nose and the face outline are two separate shapes, whereas they are combined into one shape on the destination drawing.

Morphing a full face as demonstrated on the figure below will cause the source nose to slowly vanish as the destination nose grows from the character's cheek.

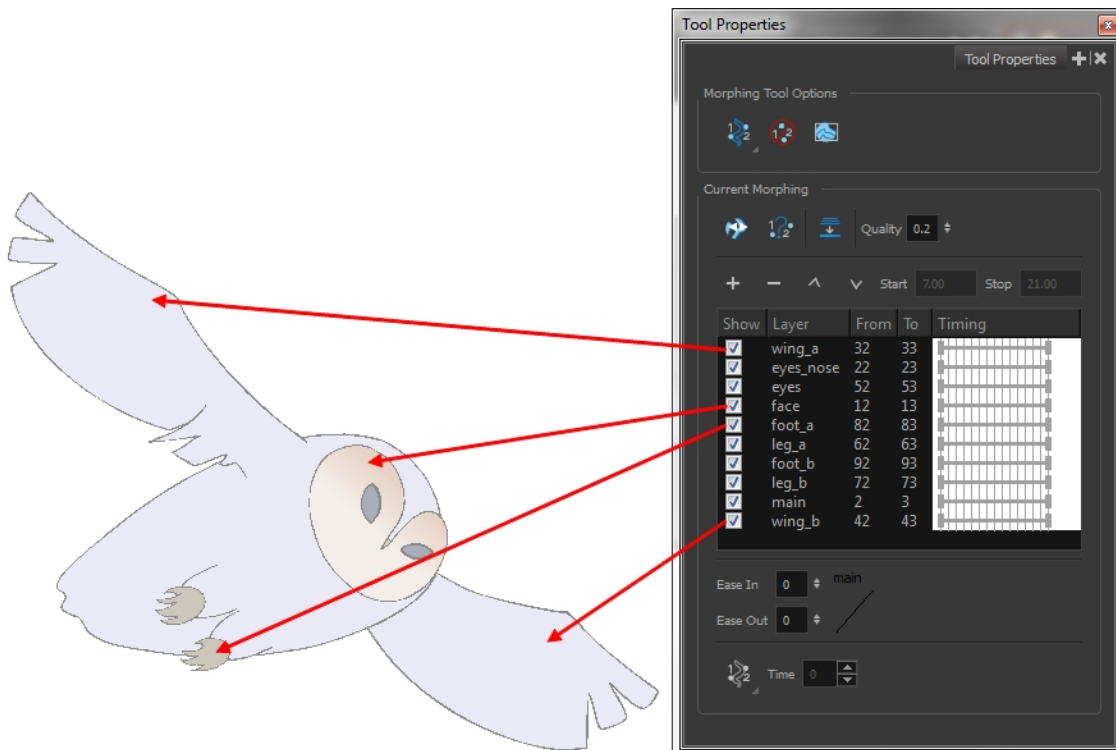

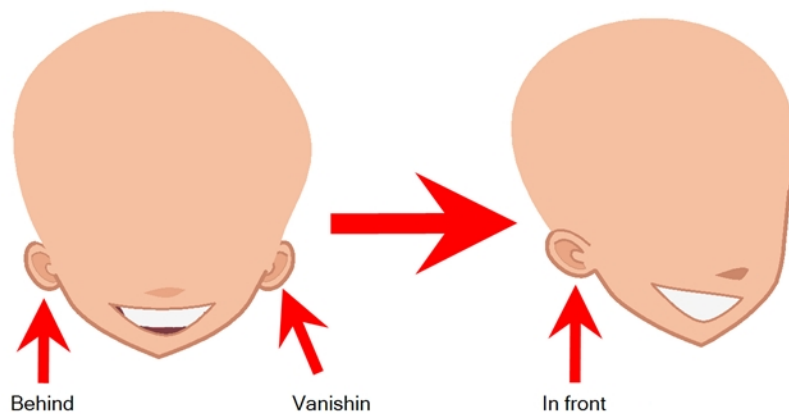

Any shape that is contained inside another one and has to morph out of that shape will be problematic for the same reasons as the nose is. At some point during the morphing sequence, the shape contained inside the face will merge with the face outline, and then become a separate shape again.

Morphing layers are all contained in the same drawing layer. It is like having a mini Timeline within a Timeline layer, or a mini Xsheet within an Xsheet column.

Each morphing layer can have its own duration and velocity. Also, because you only have a single element to handle in your Timeline or Xsheet view, it will be treated as one element for the Compositing process, making the compositor's work easier.

You can separate all of your elements into different drawing elements and have many layers, but you would have to create a large number of morphing sequences and make sure that you modify all of their timings properly.

Both solutions are correct, but morphing layers makes it easier to handle and does not change the scene structure by adding more elements, which can be very important for Cut-out animation puppets. For example, if you morph a front head to a three-quarter head where the ear needs to be separate, you do not want to add a new ear layer at the same time and have to worry about connecting it inside the puppet's construction. Instead, simply create an ear morphing layer within the head layer.

NOTE: Use a naming convention for each morphing layer such as ear_1, ear_2 or head_1, head_2. You can also use the numbers 1 to 9 for the first layer, 10 to 19 for the second one, 20 to 29 for the third one and so on. This technique is useful if you plan to do more than one morphing sequence in the same column. For example, front head to three-quarter head to side head. The three-quarter drawings will be used in both morphing sequences.

Creating Morphing with Morphing Layers

You can create morphing sequences on separated layers using morphing layers.

How to create a morph with morphing layers

1. In the Timeline view, add a new drawing element and name it properly.
2. In the first cell, draw the main source shape such as the head shape or body shape. Do not add details like eyes.

3. In the Timeline view, select the destination cell.
4. Enable and extend the Onion Skin.

5. In the destination cell, draw the second drawing.

6. In the Timeline view, select the in-between cells.
7. Do one of the following:

- Right-click and select **Morphing > Create Morphing**.
- Press Alt + M.

- In the Tools toolbar, select the Morphing  tool.
- In the Morphing Tools Properties view, click on the Add Layer  button to add a new morphing layer. When you click on a morphing layer drawing, it automatically appears on top of the others. If you want it to stay in place, for example the wing behind the body, enable the Show Morphing in Place  option in the Morphing Tool Properties view.

- Double-click on the new layer's name and name it appropriately.
- Press Enter/Return.

- Use the Up  and Down  arrow buttons to move the new layer above or below the **main** layer.
 - If placed above the **main** layer, it will be displayed in front. If it is placed below, it will be displayed behind.

13. To create new drawings, double-click on the blank area under the **From** section to create the source drawing and the **To** section for the destination drawing and type a different value than the ones used for the main layer.
14. Press Enter/Return.

You do not need to type any value for the **main** layer as it uses the one from the Xsheet column.

15. Click on the new source drawing to start drawing the new part. (Make sure that you are working on the proper drawing by verifying the name in the Camera or Drawing view's bottom left corner.)

16. In the Camera or Drawing view, draw the source drawing.

17. Once the source drawing is done, use the Morphing Tool Properties view and click on the destination drawing's name and draw it in the Camera or Drawing view.

- Repeat steps 9 to 15 for each layer needed. You can add as many layers as you want.
- Enable or disable the layers that you want to display or hide while drawing.

- If you want to change the layer duration, click on the layer and change the start and stop numbers.

The length indicator changes according to the new values.

About Morphing Key Drawings

Once you have a morphing sequence, you can add a morphing key drawing.

A morphing key drawing allows you to insert extra details into a morphing sequence. For example, during a morphing sequence you may need to insert a detail such as teeth or a mouth; this is easy to do when you use a morphing key drawing. Instead of creating an entirely new drawing, convert a computer generated in-between to a morphing key drawing and add your extra details to it and the next key drawing.

Inserting Morphing Key Drawings

A morphing key drawing converts a computer-generated morphing frame into a real drawing that you can edit. It splits the morphing sequence into two sequences, retaining any previous modifications.

How to insert a morphing key drawing

1. In the Timeline or Xsheet view, select the morphing frame you want to transform into a morphing key-frame.

2. Do one of the following:
 - In the top menu, select **Animation > Morphing > Insert Morphing Key Drawing**.
 - Right-click and select **Morphing > Insert Morphing Key Drawing**.

The new morphing key drawing appears.

3. In the Drawing or Camera view, draw your new details on the morphing key drawing.
4. In the Playback toolbar, press the Play ► button to see the result.

About Transparency Morphs

To be able to morph shapes with holes or transparent colours, it is important to understand the process of analyzing and morphing a shape. Harmony begins the process by reading the exterior outline of the entire shape. So if you are morphing a doughnut, it will first read the entire circular shape and ignore the central hole.

Once the general morphing shape is analyzed, the system will carry on analyzing the interior details such as colour zones and holes.

As you can see, because the hole was placed on top after the main shape was morphed, the centre is filled with an opaque brown colour. In order to avoid opaque holes, you have to paint the zone with a transparent colour so that you can control it and flatten the transparency to cut a hole through the main shape.

The same thing happens when you have holes painted with semi-transparent colours. To see through your shapes, you have to follow the same process as morphing shapes with holes.

Morphing Transparencies

You can use invisible colours to morph holes and transparencies.

How to morph a shape with a hole

1. In your Colour view, select an unused colour swatch and set its alpha (transparency) to 0.

2. Paint both holes on the source and destination drawings.

3. In the Timeline or Xsheet view, click on a cell in your morphing sequence.

4. Do one of the following:
 - In the Tools toolbar, select the Morphing  tool.
 - Press F3.
5. In the Tool Properties view, enable the Flatten  button.

A hole appears in the shape.

About Morphing Quality

Increasing the morphing quality settings improves the line shape between vector points. It also creates a larger file, so only increase quality when you are zooming in closely. You can adjust the quality in the Tool Properties view and in the Preferences panel.

When morphing in Toon Boom Harmony, there is a preference you can set to help you set the default quality of morphing sequences. Refer to the Preferences Guide for complete descriptions.

Setting the Morphing Quality Level

Increase the morphing quality to smooth out morphed lines.

How to set a morphing sequence's quality level

1. In the Timeline or Xsheet view, click on a cell in your morphing sequence.

2. Do one of the following:
 - In the Tools toolbar, select the Morphing  tool.
 - Press F3.
3. In the Tool Properties view, adjust the Quality level.

Converting Morphing Inbetweens to Drawings

Harmony lets you convert your morphing inbetweens to real drawings you can edit. This is useful when manually editing a morphing sequence or if you prefer to have animation timing in double frame (on twos) instead of single frame (on ones).

How to convert morphing inbetweens to drawings

1. In the Timeline or Xsheet view, select a morphed drawing in the morphing sequence you want to convert to real drawings.

2. Do one of the following:
 - In the top menu, select **Animation > Morphing > Convert Morphing to Drawings**.
 - Right-click and select **Morphing > Convert Morphing to Drawings**.

The Converting Morph dialog box opens.

3. Type the drawing basename you want to give to your new drawings. In this case, you could type **circle**.
4. Click OK.

Chapter 14: Import

Toon Boom Harmony allows you to import external content as well as being able to draw directly in the software. This means that characters, backgrounds and videos created in other drawing, painting and multimedia programs can be brought in and animated. You can import QuickTime videos, pictures, multilayered .psd files, as well as .ai, .swf, .pdf, and .fla files. You can also scan images and import them as bitmap or vectorize them.

NOTE: For sound import, refer to [Importing Sound](#) on page 1038.

About Bitmap Images

T-HFND-007-001

Images can come in many different file formats and are usually saved in a format that retains the original specifications set by the image creator. Some formats can preserve the transparency or transparent layers, while others are not resolution dependent due to their vector nature. Toon Boom Harmony supports the following bitmap image formats: JPEG, BMP, PNG (16 bits per channel RGB and RGBA), TGA, PSD (16 bits per channel), TIFF, SGI, TVG, OMF, PAL, SCAN.

When importing a bitmap image, you must decide how Harmony must process it. You can choose between the following options:

- **Keep as Original Bitmap:** This imports the image exactly as is and ensures that it can not be modified when working on the scene. This is useful for using backgrounds that were created in different software in your project.
- **Import as Toon Boom Bitmap Drawing:** This imports the image as is, but allows you to edit it using Harmony's bitmap drawing tools.
- **Import as Toon Boom Vector Drawing:** Converts a bitmap into Toon Boom vector art, which can easily be painted and edited using Harmony's vector drawing tools. This can be useful for importing line art scanned or created using a different software.

When importing images, the settings used to import are saved in your user settings.

Importing Bitmap Images As Original Bitmap

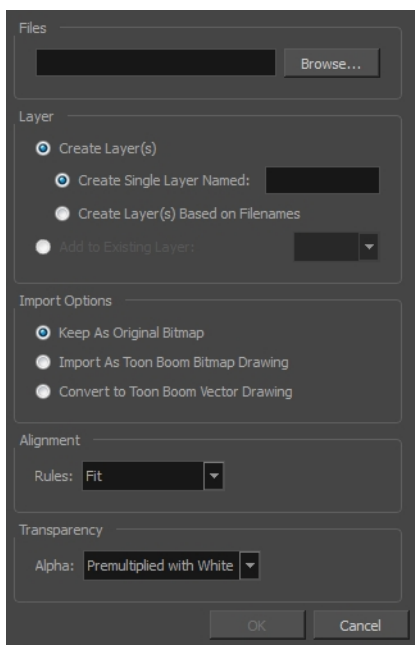

T-HFND-007-002

Importing a bitmap image in its original format ensures it is preserved exactly as is in Harmony. When importing a bitmap image, you have several options available such as where you want to import the file and how to name it.

How to import a bitmap image in its original format

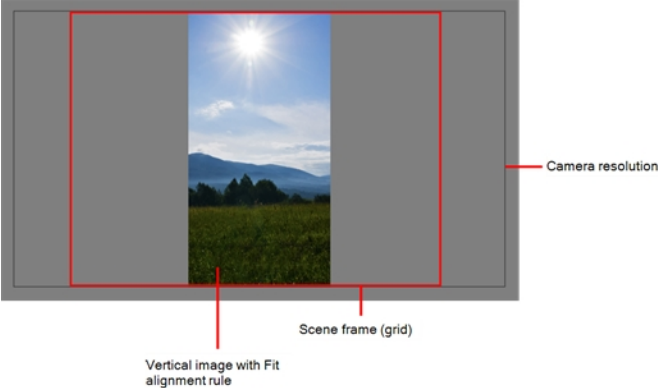

- Do one of the following:
 - From the top menu, select **File > Import > Images**.
 - In the File toolbar, click the Import Images  button.
 - In the Xsheet view, right-click anywhere in the frame area and select **Import > Images**.

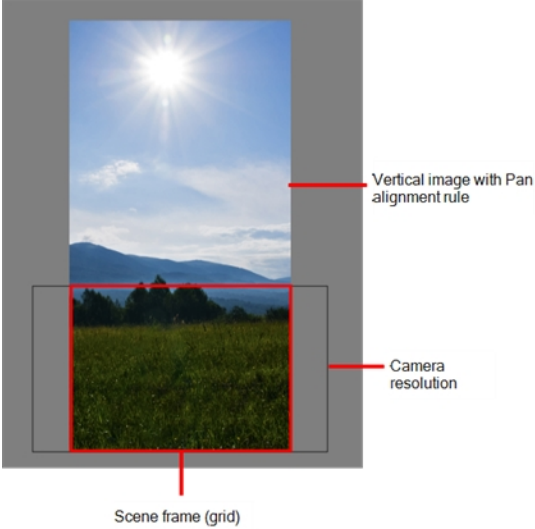

The Import Images dialog box opens.

- In the Files section of the Import Images dialog box, click **Browse** to find and select one or more images on your computer.
- Add the bitmap image to a new layer by selecting the **Create Layer(s)** option and one of the following options:
 - Create Single Layer Named:** Creates a new layer with the specified name and imports the images into it.
 - Create Layer(s) Based on Filenames:** Creates a layer based on each unique filename prefix. For example, if you import three files named a-1.tga, a-2.tga and b-1.tga, this will create two layers, one named "a" and one named "b". Layer "a" will contain the two first images and "b" will contain the third one.

- **Add to Existing Layer:** Imports the images into the specified layer. Note that you can only import into layers that are compatible with your import options. For example, if you're importing images as vector drawings, you can only import them into vector drawing layers.
4. In the Import Options section, select the **Keep As Original Bitmap** option.
 5. In the Alignment section, decide on the size and placement of your image within the camera frame. You can choose between the following options:

Parameter	Description
Fit	<p>Adjusts the image's size to fit completely within the scene's field, both vertically and horizontally, making sure the entire image is visible.</p> <p>If the image's orientation is portrait, then it will adjust the image's height to fit the field's height, without affecting the image's aspect ratio:</p>  <p>If the image orientation is landscape, then it will adjust the image's width to fit the field's width, without affecting the image's aspect ratio:</p> 
Pan	<p>This has the opposite effect to the fit parameter. The image's smallest dimension will be made to fit the scene frame's matching dimension, and the image's largest dimension will be adjusted proportionally, making the image fill the entire scene</p>

	<p>field, and bleed past its boundaries if its aspect ratio does not match the field's aspect ratio. This option can be used to import a panning background image, also referred to as a <i>pan</i>.</p> <p>If the image's orientation is portrait, it will adjust the image's width to fit the field's width, without affecting its aspect ratio:</p>  <p>If the image's orientation is landscape, it will adjust the image's height to fit the field's height, without affecting its aspect ratio:</p> 
Project Resolution	<p>Scales the image to fit the scene's resolution, making each pixel in the image take one pixel in the scene's field. For example, if the image's dimensions in pixels are half of the scene's resolution in pixels, then the image's dimensions will appear to be half of the scene field's dimensions.</p>

6. In the Transparency section, decide how the bitmap image will be antialiased, more specifically, the way the pixels along the edge are blended with the other colours. You can choose between the following options:

Parameter	Description
Premultiplied with White	Individual pixels at the edge of an image are blended with white.
Premultiplied with Black	Pixels at the edge of an image are blended with black.
Straight	Pixels at the edge of an image are blended with black, white and greys.
Clamp Colour to Alpha	Premultiplies the colour value with the alpha value. When the colour

	is clamped to the alpha, the colour value cannot be higher than the alpha value. It calculates the real colour value faster. When the RGB values are multiplied with the alpha value, that is to say, if you have a pixel of value R=247, G=188, B=29 and the alpha is 50% or the image has a 50% transparency, then the actual RGB values that are output would be half of the amounts listed above.
--	---

7. Click **OK**.

NOTE: By default, bitmap images will display in low resolution in the Camera view so as to avoid affecting playback performance. You can also adjust the display quality of a bitmap image by selecting it with the Transform tool, then opening the Bitmap Image Quality dialog via **View > Bitmap File Quality**. You can also preview your bitmap image in your scene's resolution by activating the Render Preview  mode in the Camera view.

Adjusting the Bitmap Image Display Quality

T-HFND-007-004

Your original bitmap are imported as is in your project. In the Camera view, they may appear low quality as a proxy image is displayed in its place to insure fast playback.

If the bitmap images that you imported look blurry or slightly pixelated, you can increase the image proxy display by changing the quality of the preview in the Camera view. It will not affect the final render.

How to change the bitmap image quality

1. In the Camera view, double-click on the bitmap image to enter its symbol if the image is encapsulated or simply select the bitmap image layer in the Timeline view if it's not.
2. Do one of the following:
 - From the top menu, select **View > Bitmap File Quality**.
 - From the Camera menu, select **View > Bitmap File Quality**.
 - Press **Ctrl + Q** (Windows/Linux) or **⌘ + Q** (Mac OS X).

The Bitmap Image Quality dialog box opens.

3. Drag the slider to the right to improve the quality.
4. Click **OK**.
5. If you are inside a symbol, go to the top of the Camera view and click **Top** to exit the symbol and return to your scene.

Importing Bitmap Images As Toon BoomBitmap

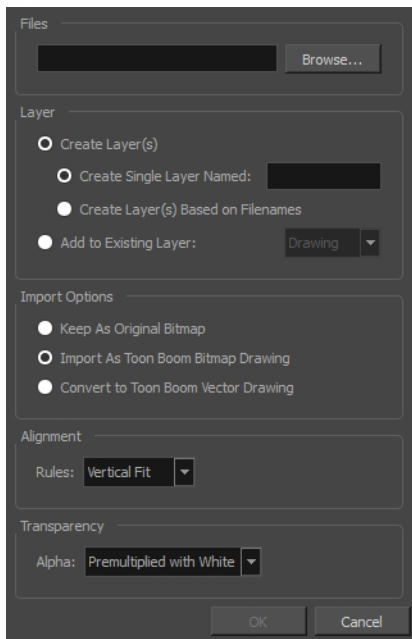

T-HFND-007-002

Importing a bitmap image as Toon Boom bitmap preserves its original detail, but allows the user to modify them using Harmony's bitmap drawing tools.

How to import a bitmap image as a Toon Boom bitmap drawing

1. Do one of the following:
 - From the top menu, select **File > Import > Images**.
 - In the File toolbar, click the Import Images  button.
 - In the Xsheet view, right-click anywhere in the frame area and select **Import > Images**.

The Import Images dialog box opens.

1. In the Files section of the Import Images dialog box, click **Browse** to select one or more images from your computer.
2. Select the destination for your images:
 - **Create Single Layer Named:** Creates a new layer with the specified name and imports the images into it.
 - **Create Layer(s) Based on Filenames:** Creates a layer based on each unique filename prefix. For example, if you import three files named a-1.tga, a-2.tga and b-1.tga, this will create two layers, one named "a" and one named "b". Layer "a" will contain the two first images and "b" will contain the third one.

- **Add to Existing Layer:** Imports the images into the specified layer. Note that you can only import into layers that are compatible with your import options. For example, if you're importing images as vector drawings, you can only import them into vector drawing layers.

2. In the Alignment section, decide on the size and placement of your image within the camera frame. You can choose between the following options:

Parameter	Description
Vertical Fit	<p>Adjusts the image's size so that its height matches the scene's height, without affecting its aspect ratio.</p> 
Horizontal Fit	<p>Adjusts the image's size so that its width matches the scene's width, without affecting its aspect ratio.</p> 
Actual Size	<p>Imports the image in its actual size, without adjusting its size relative to the scene's resolution. For example, if the image's dimensions in pixels are half of the scene's resolution in pixels, then the image's dimensions will appear to be half of the scene field's dimensions.</p>

3. In the Transparency section, decide how the bitmap image will be antialiased, more specifically, the way the pixels along the edge are blended with the other colours. You can choose between the following options:

Parameter	Description
Premultiplied with White	Individual pixels at the edge of an image are blended with white.
Premultiplied with Black	Pixels at the edge of an image are blended with black.
Straight	Pixels at the edge of an image are blended with black, white and greys.

4. Click **OK**.

Vectorizing Images on Import

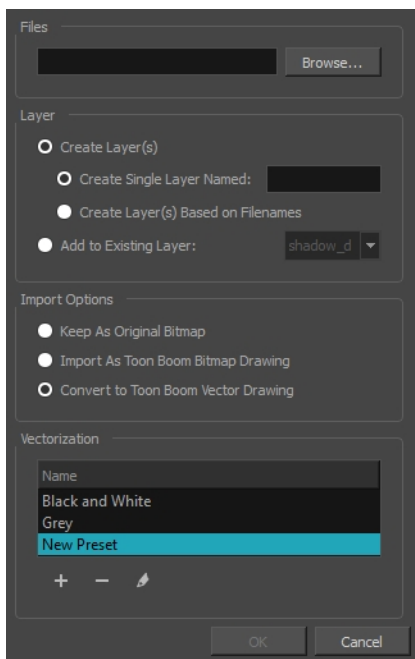

You can import bitmap images as vector drawings, which allows you to edit them using Harmony's vector drawing tools. This is especially useful to convert bitmap line art scanned or created in a different software into vector line art so it can be painted in Harmony.

How to import and vectorize a bitmap image

1. Do one of the following:
 - From the top menu, select **File > Import > Images**.
 - In the File toolbar, click the Import Images  button.
 - In the Xsheet view, right-click anywhere in the frame area and select **Import > Images**.

The Import Images dialog box opens.

1. In the Files section of the Import Images dialog box, click **Browse** to select one or more images from your computer.
2. Select the destination for your images:

- **Create Single Layer Named:** Creates a new layer with the specified name and imports the images into it.
 - **Create Layer(s) Based on Filenames:** Creates a layer based on each unique filename prefix. For example, if you import three files named a-1.tga, a-2.tga and b-1.tga, this will create two layers, one named "a" and one named "b". Layer "a" will contain the two first images and "b" will contain the third one.
 - **Add to Existing Layer:** Imports the images into the specified layer. Note that you can only import into layers that are compatible with your import options. For example, if you're importing images as vector drawings, you can only import them into vector drawing layers.
3. In the Import Options section, select the **Convert to Toon Boom Vector Drawing** option.
 4. In the Vectorization section, decide whether you want to import your image in black and white or in grey-scale. You can also click the New Preset **+** button to create a custom vectorization parameter preset.
 - **Black and White:** Vectorizes drawings as a solid black line; creates a 100% vector-based drawing. The outlines of your drawings will be painted with the Vectorized Line colour swatch of your scene's colour palette.
 - **Grey:** Vectorizes your image as a mix of vector contour and greyscale bitmap filling. Lines keep the texture from the scan, and the white of the paper becomes transparent.

Grey preset

Black and white preset

NOTE: You can double-click on any of the presets at any time to open the Vectorization Parameters dialog box to customize your option.

5. Click **OK**.

Your vectorized images will appear in their selected destination.

About Vector File Import

T-HFND-007-005

You can import AI (Adobe Illustrator) and PDF files into Toon Boom Harmony to convert your files to the Toon Boom format (TVG) and create a colour palette based on the colour settings of the original file.

When importing AI and PDF files:

- RGB is supported, CMYK is not.
- Gradients and textures are not supported.
- Only legacy versions of Adobe Illustrator are supported. Exported SWFs, including Actionscript 2 and Actionscript 3, cannot be imported.
- When importing an Illustrator or PDF file in Toon Boom Harmony, by default the file will be imported as separate layers. The import will use the Illustrator file's top level groups as separate layer names. However, you can change this behaviour by deselecting the PDF/Illustrator Import as Separate Layers option, to import your file as a single layer .

If a project was started in Adobe Flash and needs a more professional boost, such as camera movements or multiplaning, it can easily be imported into Harmony.

The actual *.fla file is not supported in Harmony, so you must export your project from Adobe Flash.

Importing AI and PDFs

T-HFND-007-006

You can import vector Adobe Illustrator files as well as PDFs through the Library view and File menu. Make sure you have the rights to modify your Library folder and the your files are in RGB format.

How to import an AI or PDF file

1. In the Library view, right-click on the Stage Advanced Library folder and select **Right to Modify** to unlock the library folder. Make sure the Lock icon disappears from the folder. If not, your library will remain locked and you will not be able to import files.

2. Do one of the following:
 - In the top menu, select **File > Import > SWF, Illustrator Files to Library**.
 - Right-click on any unlocked folder and select **Import Files**.

The browser window opens.

3. Find and select your AI or PDF file in the Import Files dialog box and click **Open**.

The Rename dialog box opens.

4. Type in a name for the new template or keep the name of the original AI or PDF file.
5. Click **OK**.

A new template folder is created in the Library view.

6. Drag the new template folder from the Library view to the left side of the Timeline view. Wait until the copy cursor  appears before releasing the folder.

The message window opens.

7. The colour recovery dialog box appears, requesting that a colour recovery should occur. Before clicking the Yes button, you have the option of selecting the **Do Not Ask Again For This Session** option if you plan to import multiple .ai or .pdf files.

The colour palette used to create the .ai or .pdf file is imported and a new palette is created under the imported file's name.

Importing SWF Files

You can import `.swf` files in Harmony that were published using any version of Flash Player, up to version 14. Note that some effects may not appear when imported in Harmony.

How to import a SWF file

1. In the Library view, right-click on the Stage Advanced Library folder and select **Right to Modify** to unlock the library folder. Make sure the Lock icon disappears from the folder. If not, your library will remain locked and you will not be able to import files.

2. Do one of the following:
 - In the top menu, select **File > Import > SWF, Illustrator Files to Library**.
 - Right-click on any unlocked folder and select **Import Files**.

The browser window opens.

3. Find and select your `.swf` file from the Import Files dialog box and click **Open**.

The Rename dialog box opens.

4. Type a name for the new template or keep the name of the original `*.swf` file.
5. Click **OK**.

A new template folder is created in the Library view.

6. Drag the new template folder from the Library view to the left side of the Timeline view. Wait until the copy cursor  appears before releasing the folder.

- The colour recovery dialog box appears, requesting that a colour recovery should occur. Before clicking the Yes button, you have the option of selecting the **Do Not Ask Again For This Session** option. This might be useful if you plan to import multiple *.swf files.

The colour palette used to create the .ai or .pdf file is imported and a new palette is created under the imported file's name.

NOTE: All the Flash layers are automatically attached to a parent peg called GlobalFlashPeg. **DO NOT DELETE THIS PEG.** To maintain the look of your movie, it's important not to delete this peg or detach its child layers.

The Adobe Flash file layers appear in the Timeline view. Symbols that were created in Flash become regular drawing layers, but can be reconverted into symbols in Harmony. Symbols within symbols or drawings within symbols collapse into their corresponding parent symbol.

NOTE: Some layers in your .swf movie may be combined in a single layer as a result of optimization enhancements in your movie file. You can easily move these elements back onto separate layers.

In addition, all drawing elements that are dynamically linked to the Toon Boom Harmony file are grouped together in one folder. In our example, this means that when you scroll through the Drawing Substitution preview in the Library view, the different hand, leg, tentacles, antennae, torso and facial positions are all organized together.

Distributing SWFs to Layers

In some instances, due to an optimization enhancement in the exported SWF file (CS4), some of the layers might be combined as a single layer. If so, you can quickly redistribute these elements onto individual layers again.

How to distribute to layers

1. In the Tools toolbar, click the Select  tool.
2. In the Camera view, select the drawing that contains elements you want to redistribute onto individual layers. To select the all the elements of the selected drawing layer, press Ctrl + A (Windows/Linux) or ⌘ + A (Mac OS X).
3. Do one of the following:
 - From the top menu, select **Drawing > Distribute to Layers**.
 - In the Tool Properties view of the Select tool, click the Distribute to Layers  button.

The number of drawing layers corresponding to the different grouped elements are created in the Timeline view. The selected elements in the original drawing layer are removed. Each element is distributed onto a new drawing layer.

4. Repeat the process for each drawing that contains elements to redistribute.

About FLA Import

You can export files from Flash and import them in Harmony to transfer character rigs, props and backgrounds.

© 2015 Crazy Chicken by Clémence Dufresne

Flash import is available on all three editions of Harmony on Windows and Mac OS X. It is not possible to do so on Linux versions.

On the Flash side, users can work with these versions:

- Adobe Flash CS5
- Adobe Flash CS5.5
- Adobe Flash CS6
- Adobe Flash CC
- Adobe Flash CC 2014
- Adobe Flash CC 2015

NOTE: Exports from older versions of Flash are not possible.

At the scene level (top timeline), you must have a symbol, such as a movie clip or graphic. Colour shapes, shape lines, drawing objects, groups and bitmaps at the scene level won't be exported. If these elements are present, you will be prompted to perform a clean up of the scene level. For details on importing Flash files, see [About Flash File Creation on page 871](#)

As part of preparing to import Flash files in Harmony, you must add an extension to Flash using Adobe Extension Manager—see [Installing the Export to Harmony Option on page 856](#).

It is important to use the correct version of Adobe Extension Manager:

- If more than one version of Flash is installed on your computer, be careful where you install the extension. If it's added to Adobe Extension Manager of Flash CS6, the extension will only be added in this version and not the other.
- If you have a previous version of the extension, you must remove it first and install the latest extension—see [About FLA Import on page 854](#).

Harmony includes a script specially created to import FLA Export packages. You must add this script to your interface in order to use it—see [Displaying the Import Flash Scene Icon on page 866](#).

When you export your FLA files, a folder will be created that contains the `stage.tp1` and `export.json` files, as well as all the `.swf` and `.txt` files in your scene. The `export.json` file is used by a Harmony script to organize and construct the hierarchy from your exported files.

Once the Flash project is successfully imported into Harmony, here's how the hierarchy was constructed:

- Each symbol has its own peg in which all the transformation information is stored.
- The pivot information is stored in the peg's Layer Properties (Pivot fields). The pivot information came from the rotation point of the symbol in Flash.
- Registration point of the symbol in Flash represents the centre of the drawing space in Harmony. Therefore, the position of the drawing inside a symbol will be exactly the same in Stage.

- One colour palette is created for each Flash import. One colour swatch is created per RGB value. If you have more than one zone using the same colour, they will be linked to the same colour swatch.
- If there are masks in your Flash project, they will be reconstructed in Harmony using Cutter effects. Harmony is now able to understand when more than one symbol share the same mask in Flash. Each symbol sharing the same mask will be grouped by a composite and connected to the cutter.

Installing the Export to Harmony Option

The extension is required in order for Flash to export files to Harmony. The extension is called **Export to Harmony .zxp** and is located here:

OS	Edition	Location
Windows	Premium	C:\Program Files (x86)\Toon Boom Animation\Toon Boom Harmony [version] Premium\resources\flash
	Advanced	C:\Program Files (x86)\Toon Boom Animation\Toon Boom Harmony [version] Advanced\resources\flash
	Essentials	C:\Program Files (x86)\Toon Boom Animation\Toon Boom Harmony [version] Essentials\resources\flash
Mac OS X	Premium	Applications > Toon Boom Harmony [version] Premium > tba > resources > flash
	Advanced	Applications > Toon Boom Harmony [version] Advanced > tba > resources > flash
	Essentials	Applications > Toon Boom Harmony [version] Essentials > tba > resources > flash

NOTE: Before installing the extension, you must remove all Harmony offline and database preferences.

How to install the Export to Harmony extension

1. Launch Adobe Extension Manager.
2. In the top-right corner of the Adobe Extension Manager, click on **Install**.
An Open dialog appears.
3. In the Open dialog, browse to and select the **Export to Harmony.zxp** file, then click on Open.
A message opens informing you that you're about to install the Export to Harmony extension.
4. Click on **Accept**.

You may see the following message confirming that you want to install the extension. Click **Install**.

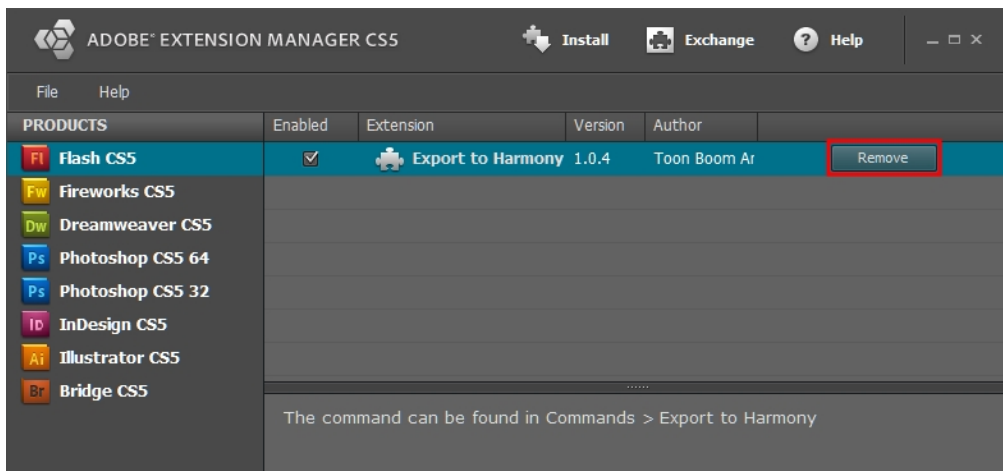

5. In order for the changes to take effect, you must close and restart Adobe Flash.
6. Click **OK**.

How to remove a previously installed Export to Harmony.zxp extension (if applicable)

1. If open, close Adobe Flash.
2. Start Adobe Extension Manager.
3. From the Products list, select **Adobe Flash**.

If you have a previous version of the **Export to Harmony.zxp** extension installed, it will be listed in the right pane.

4. Select the extension and click **Remove**.

A message opens asking you to confirm the removal of the extension.

5. Click **Yes**.

Adobe has stopped maintaining and updating their Extension Manager CC, therefore, it has become difficult to install extensions. In order to link an extension from Animate CC, follow the steps below.

How to install an extension on Windows with Adobe Animate CC version 2015 and higher

1. Ensure the following software is installed:
 - Adobe Creative Cloud
 - Animate CC and Mobile Device Packaging

2. Download the ExManCmd from Adobe's website.

<https://docs.toonboom.com/go/download/ExManCmdWin>

3. Unzip the ExManCmd_win.zip package.
4. Put the ExManCmd_win folder in a safe place.

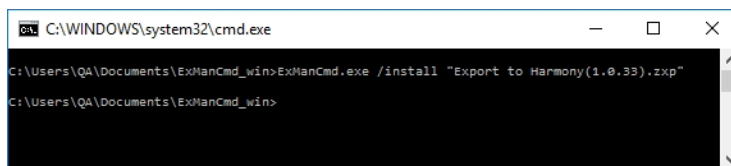

NOTE: The ExManCmd_win folder must not be deleted; this folder is necessary for installing or updating .zxp files.

5. Copy the package containing the plug-in from the Harmony installation folder to your Downloads folder:

C:\Program Files (x86)\Toon Boom Animation\Toon Boom Harmony 14.0
Advanced\resources\flash\flashexport.zip

6. Unzip the **flashexport.zip** package.
7. Open the folder containing the unzipped files.
8. Move or copy the **Export to Harmony.zxp** file directly into the ExManCmd_win folder.
9. In the ExManCmd_win folder, hold Shift and right-click to select **Open command window here**.
10. Enter the following command:
ExManCmd.exe /install <filename.zxp>.
11. Press **Enter**.

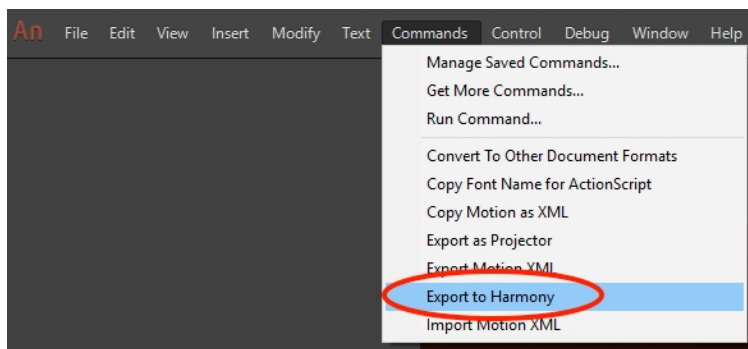

If no error message displays, the extension has been installed on your computer and recognized by the Extension Manager CC.

```
C:\WINDOWS\system32\cmd.exe
C:\Users\QA\Documents\ExManCmd_win>ExManCmd.exe /install "Export to Harmony(1.0.33).zxp"
C:\Users\QA\Documents\ExManCmd_win>
```

12. Open Animate CC.
13. Access Top Menu > Commands.

If the Export to Harmony option appears in the Top Menu > Commands list, your installation was successful.

NOTE: If you have a region language other than English (US) installed on your computer, or if you have more than one language installed on your computer, Animate CC may not be able to detect in which language folder the extension has been installed. If this occurs, you will not be able to see the Export to Harmony menu option in Top Menu > Commands list. To correct this, proceed to [How to ensure Adobe detects extension files installed on your computer on page 859](#).

How to ensure Adobe detects extension files installed on your computer

1. Browse to:

C:\Users**<UserName>**\AppData\Local\Adobe\Animate **<VersionNumber>**

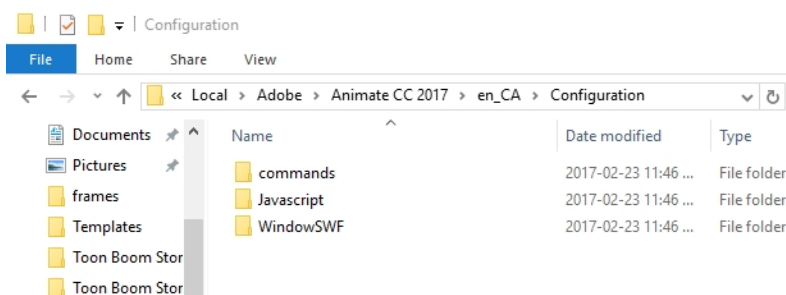

If Adobe detects more than one language on your computer, you will see multiple language folders in the path.

For example:

2. Look inside each folder to detect the main language used by Adobe on your computer. To do so, compare the contents of both folders.

For example, inside the en_CA\Configuration:

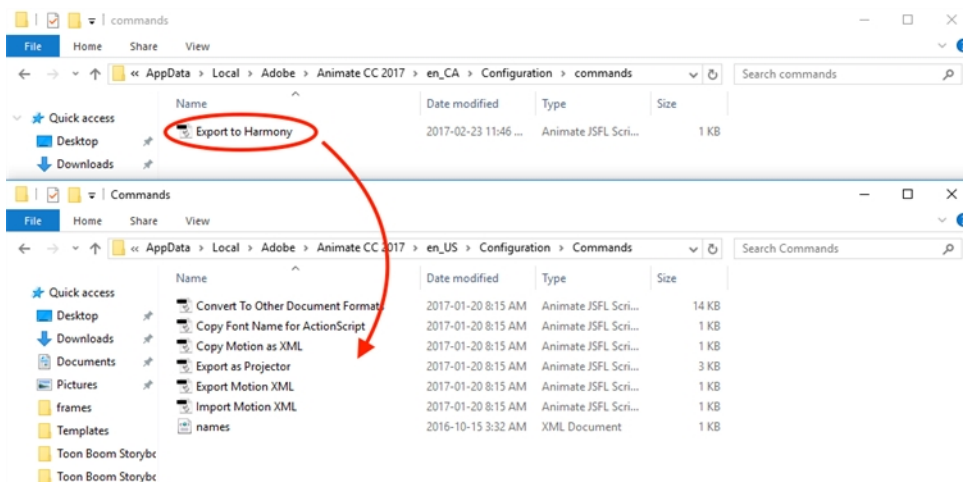

For example, inside the en_US\Configuration:

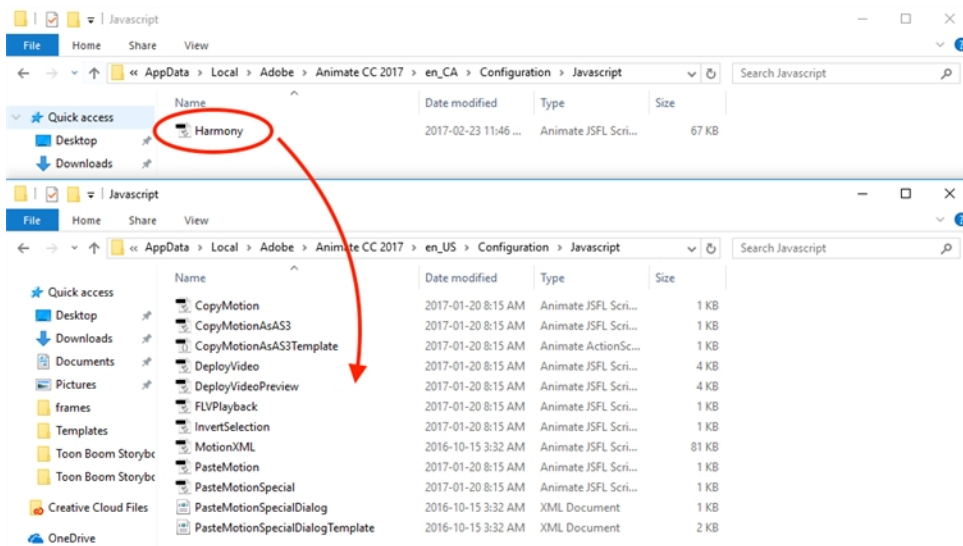

The main folder is the one with more files. In this case, Adobe is using English (US) as the main language. The folder en_CA only contains what was installed with the extension installation: commands, Javascript and WindowSWF.

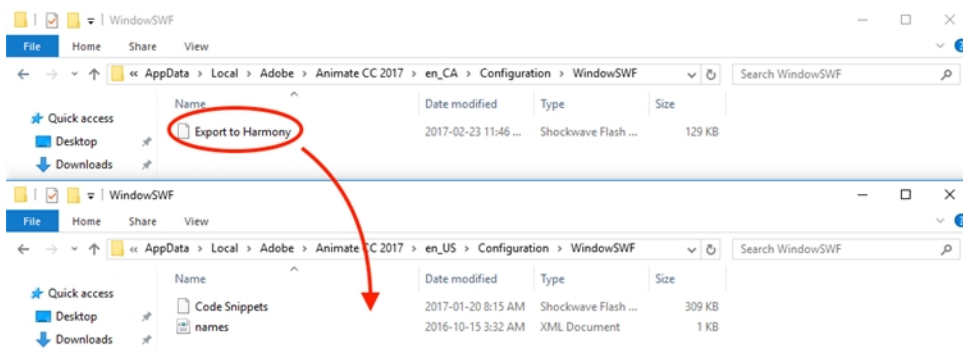

3. Copy and paste the contents of the commands folder within the sub-language folder, to the commands folder within the main language folder .

4. Copy and paste the contents of the Javascript folder within the sub-language folder, to the Javascript folder within the main language folder.

5. Copy and paste the contents of the WindowSWF folder within the sub-language folder, to the WindowSWF folder within the main language folder.

How to install an extension on Mac OS X with Adobe Animate CC version 2015 and higher

1. Ensure the following software is installed:
 - Adobe Creative Cloud
 - Animate CC and Mobile Device Packaging
2. Download the ExManCmd from Adobe's website.
<https://docs.toonboom.com/go/download/ExManCmdMac>
3. Unzip the ExManCmd_mac file.
4. Put the ExManCmd_mac folder in a safe place.

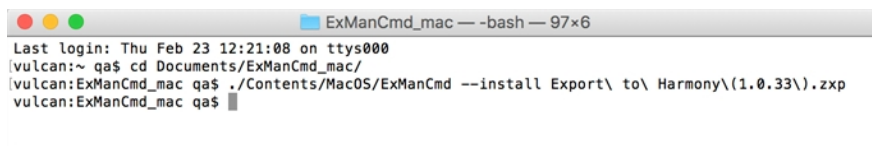

NOTE: The ExManCmd_mac folder must not be deleted; this folder is necessary for installing or updating .zxp files.

5. Copy the package containing the plug-in from the Harmony installation folder to your Downloads folder:
 /Applications/Toon Boom Harmony 14.0 Advanced/tba/resources/flash/flashexport.zip
6. Unzip the **flashexport.zip** package.
7. Open the folder containing the unzipped files.
8. Move or copy the **Export to Harmony.zxp** file directly into the ExManCmd_win folder.
9. Drag and drop the .zxp file directly into the ExManCmd_mac folder.
10. In Terminal, go to the folder where the ExManCmd_mac package was extracted.
 For example, if you have put the ExManCmd_mac folder into the Downloads folder:

```
cd Downloads/ExManCmd_mac/
```
11. Enter the following command:

```
Contents/MacOS/ExManCmd --install <filename.zxp>
```
12. Press **Enter**.

If no error message displays, the extension has been installed on your computer and recognized by the Extension Manager CC.

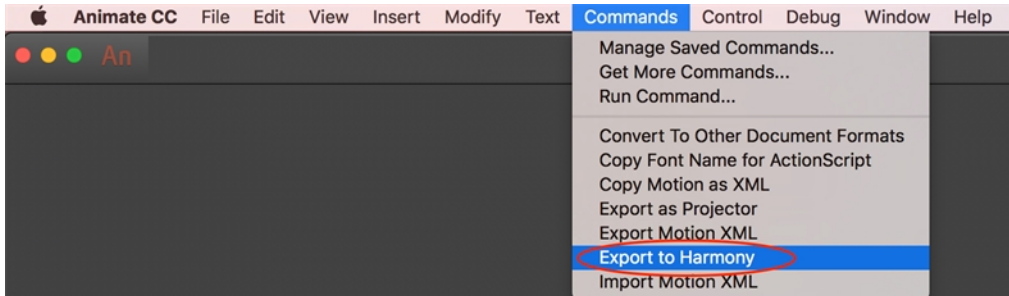

```

ExManCmd_mac -- -bash -- 97x6
Last login: Thu Feb 23 12:21:08 on ttys000
[vulcan:~ qa$ cd Documents/ExManCmd_mac/
[vulcan:ExManCmd_mac qa$ ./Contents/MacOS/ExManCmd --install Export\ to\ Harmony\{1.0.33\}.zxp
[vulcan:ExManCmd_mac qa$ █
  
```

13. Open Animate CC.
14. Access Top Menu > Commands.

If the Export to Harmony option appears in the Top Menu > Commands list, your installation was successful.

Exporting FLA Files

How to export FLA files for Harmony from Adobe Flash

1. Open your .fla file in Adobe Flash.

NOTE: In case of a new file, it needs to be saved before continuing the exportation process. If not, the export won't be completed.

2. Return to the scene level.

Before exporting to Harmony, it is assumed that you are at the scene level even if you're not.

3. Do one of the following:

- Older versions of Adobe Flash: Select **Window > Other Panels > Export to Harmony**.
- Adobe Flash CC: **Window > Extensions > Export to Harmony**.

NOTE: This window must be opened once after installing the extension in the extension manager because it creates a direct link to Harmony (even if the window is not used). Afterwards, you do not have to reopen it if there is no need to change the option.

The Export to Harmony window opens from which you can set the resolution of the files as it will appear in Harmony. The default resolution is set to 1920 x 1080, like the HD default resolution value of Harmony. If needed, you can change the compression: Photo (JPG) or Lossless (PNG).

4. Do one of the following:

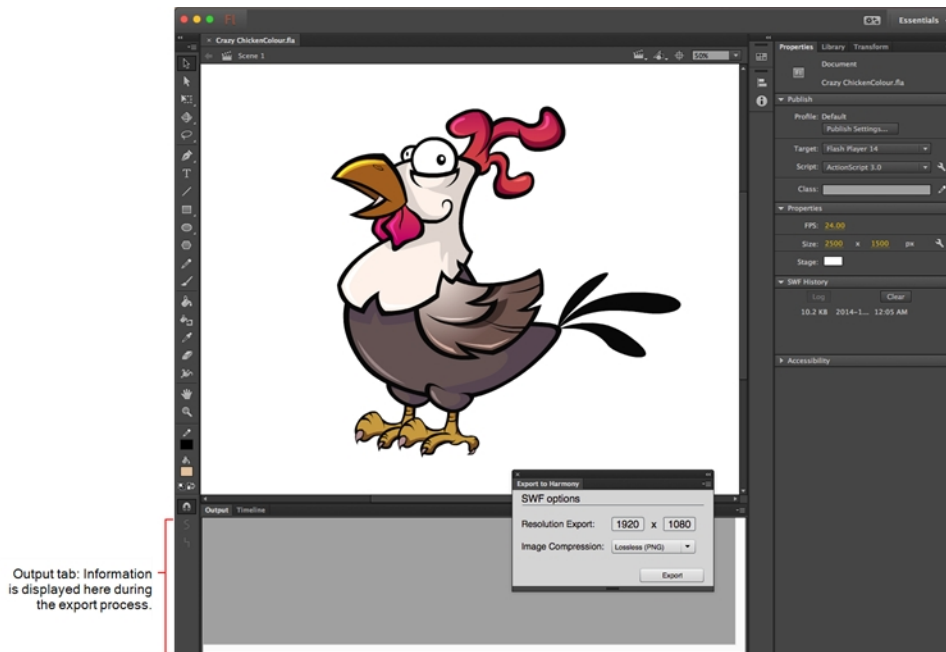

- In the Export to Harmony window, click **Export** button.
- Select **Commands > Export to Harmony**.

The Output tab displays information about the conversions necessary for the export including:

Distributing to layers, breaking apart, the presence of shapes at the scene level, ungrouping all groups to verify if any symbols are hidden inside, breaking drawing objects to transfer them as shapes, drawing substitutions, and so on. Problematic situations will also be mentioned. If nothing appears in the Output tab, then your .fla file is clean and does not need any conversions.

The `.txt` files contain the drawing substitution information and at which frame they are exposed. A `.swf` file is created for each symbol in Flash and a `.xml` file is created of them. The corresponding `export.json` file is also created, which you will need when importing your Flash scene in Harmony. These files are in a folder located at the same location as the `.fla` file. The folder name is the same as the `.fla` file.

NOTE: If a folder with the same name as the `.fla` file already exists, you will be prompted to replace the folder. Be aware that saving Flash projects as `.xml` files will automatically create a folder with the same name as the `.fla` file. In this case, the folder of the export will be created inside the folder of the `xml`. If this not what you want, place a copy of the `.fla` in another path on your computer before the export.

Displaying the Import Flash Scene Icon

When importing Flash files, the Scripting toolbar must be displayed, which should contain the Import Flash Scene icon. If the icon does not appear in the Scripting toolbar, add it to the toolbar. Note that you will only have to do this once. After that, you can import Flash files whenever needed.

How to display the Flash Import script icon

1. From the top menu, select **Windows > Toolbars > Scripting**.

The Scripting toolbar bars appears below the File toolbar in the upper-left of the Harmony interface.

2. Click the Manage Scripts  button.

The Scripts Manager opens.

3. From the Files section, select **TB_Import_Flash_Scene.js**.

On your computer, here is the location of the script file:

- **Windows:**
 - **Toon Boom Harmony Premium:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Harmony\1400-scripts

- **Toon Boom Harmony Advanced:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Advanced\1400-scripts
 - **Toon Boom Harmony Essentials:** C:\Users\[user_name]\AppData\Roaming\Toon Boom Animation\Toon Boom Essentials\1400-scripts
- **Mac OS X:**
 - **Toon Boom Harmony Premium:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Harmony/1400-scripts
 - **Toon Boom Harmony Advanced:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Advanced/1400-scripts
 - **Toon Boom Harmony Essentials:** /Users/[user_name]/Library/Preferences/Toon Boom Animation/Toon Boom Essentials/1400-scripts

On Mac OS X, the Library folder is a hidden folder. To display the display the folder, hold down the Alt key.

- **Global:** [Server_Name] > USA_DB > scripts
- **Environment:** [Server_Name] > USA_DB > environments > [environment_name]
- **Job:** [Server_Name] > USA_DB > jobs > [job name]
- **User:** [Server_Name] > USA_DB > users > [user_name] > stage > 1400-scripts

- From the Functions section, select **TB_Import_Flash_Scene** and click the arrow button to move it to the In Toolbar section.

- Click **OK**.

The Import Flash icon appears in the Scripting toolbar. Everything is now ready to import Flash scenes.

ImportFlash Scene

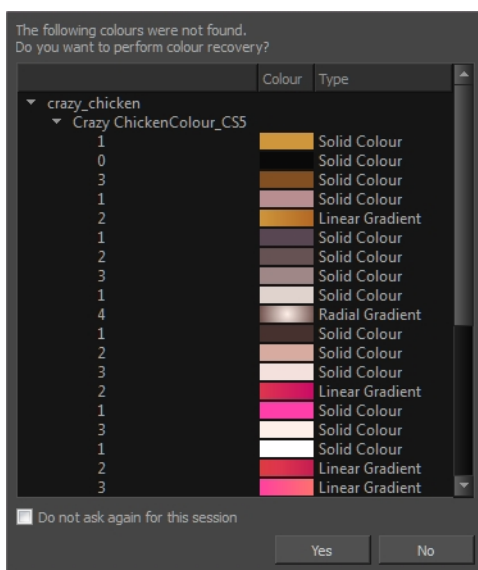

Importing FLA Files

Once your extension is installed, your FLA file has been exported and you displayed the FLA import script in your toolbar, you are ready to import your FLA file in Harmony.

How to import FLA files

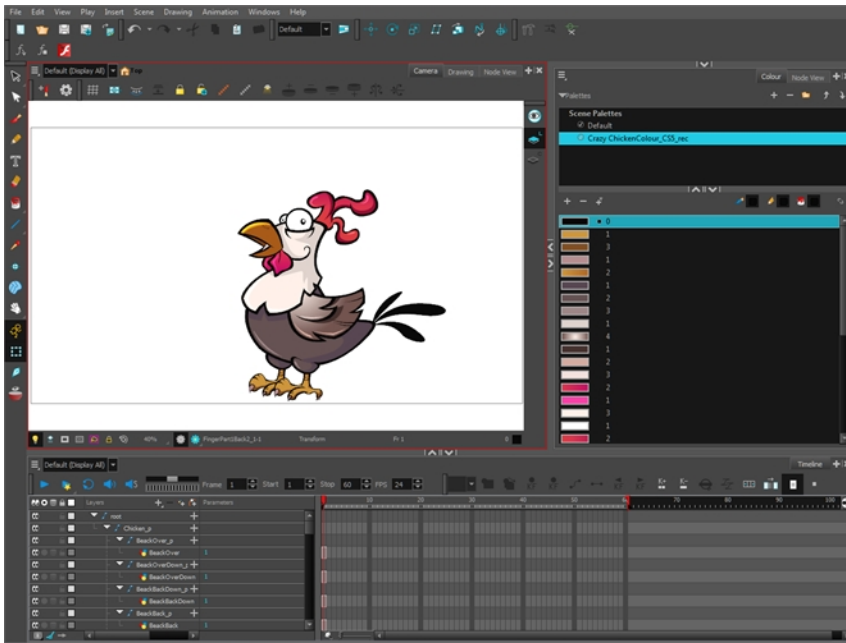

1. In the Scripting toolbar, click the Import Flash  button.
2. In the Import Files dialog box, locate the **export.json** file contained in the folder that was created when you exported your files from Flash.
3. Click **Open**.

In a few moments, the colour recovery dialog box appears, requesting a colour recovery.

4. Before clicking **Yes**, you have the option of selecting the **Do Not Ask Again For This Session** option.

In a few moments, the **.fla** files are imported in Harmony.

5. In the Node view, press 1 to zoom out of the Node view and see the entire node system.

About Flash File Creation

The following points are guidelines for you to create optimal Flash files to export to Harmony.

Scene Root

What can be at the scene root:

- Only symbols. A minimum of one symbol is necessary. It could be a MovieClip or a graphic.

What cannot be used at the scene root:

- Shapes: Colour shapes and line shapes
- Bitmaps
- Drawing objects
- Groups: The group works differently at the scene level. They are understood as shapes at the scene level—see [Mixed Layers on page 873](#).

Timeline

These features can be used in the Flash file, but will not appear in Harmony Advanced:

- Guide layers for references
- Locked layers
- Disabled layers
- Folders in the Timeline view
- Other: Several symbols on the same layer/keyframe. In this case, Harmony Advanced will separate them, giving them a proper layer. In other words, a Distribute to Layers action performed in the process of exporting/importing.

Not recommended:

- Mixed layers—see [Mixed Layers on page 873](#)
- Symbols with shapes, bitmaps, or group on the same layer/keyframe
- Symbols with drawing objects

Library View

In the Library view, the following will not be exported:

- ActionScript Linkage
- Embedded fonts

Effects

The following effects will not be exported:

Filters	Adjust Colour
---------	---------------

	Drop Shadow Blur Glow Gradient Bevel Gradient Glow
Colour Effects (other than None)	Alpha Advanced Brightness Tint
Display	Blending (other than Normal): <ul style="list-style-type: none"> • Layer • Darken • Multiply • Lighten • Screen • Overlay • Hard Light • Add • Subtract • Difference • Invert • Alpha • Erase
	Render: Cache as Bitmap
	Component parameters

Drawing Features

- Width tool: Any change on the thick and thin of a line
- Line:
 - Width
 - Cap: Any change of the line cap will be replaced by the round cap (None and Square)
 - Join: Any change of the line join will be replaced by the round join (Miter and Bevel)

- Gradient (Flow): Reflect colour, Repeat colour
- Import Bitmap: When importing .swf files, you can import files that have an image compression of Photo (JPG) or Lossless (PNG).

Mixed Layers

Mixed layers are something you must seriously consider before trying to export a Flash project to Harmony. Otherwise, there can be unexpected results or no export at all. In fact, it's best to avoid having mixed layers altogether.

A mixed layer is defined as a layer that has more than one instance of objects at the same keyframe. It could be a mix of symbols and groups; groups and drawing objects; symbols and shapes, and so on. Since Harmony understands symbols better than groups or drawing elements, some information can be lost along the way.

Parameter	Description
Drawing Objects	No matter what is inside a drawing object, it will always be understood as a shape. So if a drawing object shares the same layer with a shape, it won't be a real mixed layer, since they are all understood as shapes.
Symbols and Drawing Objects/Shapes on the Same Layer	<p>If there are symbols and drawing objects/shapes sharing the same layer, the symbols will be separated from them and all the drawing objects/shapes will be kept together. Drawing objects and shapes cannot be separated. In Harmony, the symbols will have their own Drawing node and the drawing objects/shapes will share the same Drawing node. Since only symbols can have a name, its name is propagated to the Drawing node and peg.</p> <p>Drawing objects and shapes, however, can't do this. Drawing objects and shapes will receive the name of the MovieClip followed by an underscore and an appropriate number. For example, if you have a group inside a symbol called <i>HEAD</i>, the group will be named <i>HEAD_1</i> if there is already a Drawing node that was created with the same name.</p>
Mixed Instances at the Same Level as a Symbol	<p>Mixed instances at the same level as a symbol can occur when, at the same level inside a symbol, there is more than one type of element sharing the same timeline at a specific frame. Those elements may be mixed layers.</p> <p>Type of problems that can occur if mixed instances are kept:</p> <ul style="list-style-type: none"> • Order of appearance can be lost • Some layers can merge together • Transparency of shapes can cut other shapes

About PSD Files

Harmony allows you to export the contents of your scene as a PSD layout. This can be helpful for scene setup, background art retakes, or even planning of animation.

Before exporting a layout, all the elements must be well positioned. For example, if you plan to include a camera movement in this scene, you should also set this up, as you can export the camera keyframes to generate a clear and complete layout. You can also create all the layouts for your production in the same Harmony project which can be imported later on when you start each scene's project. This will help set up the scene and begin its creation. You can use the layout .psd files to create the background art of each scene and make sure everything is correctly framed and at the right size. Finally, you can also have a layer with a drawing of the rough poses of the character or action and generate your layout posing from there.

NOTE: Because the layout image is one static .psd file, only the first frame of your drawing layers will be exported—see [Staging on page 899](#) and [Motion Paths on page 955](#).

Importing Multi-layer PSD Files

T-HFND-007-003

PSD files (a format exportable exclusively from Adobe Photoshop) are unique in that they are able to retain multiple layers. This is advantageous as the image remains fully editable in terms of any colour correction, effects, masking, transparency, or compositing that were made to the **.psd** file in Adobe Photoshop. Harmony supports 8 and 16 bit files.

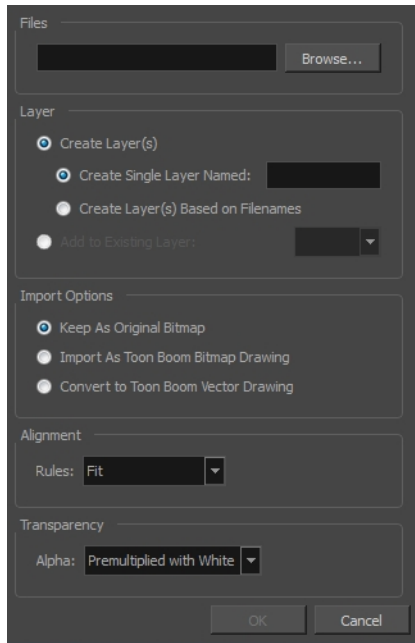

NOTE: Note that your **.psd** image file must be set to RGB mode within Adobe Photoshop prior to being imported into Harmony.

How to import a multi-layer PSD file

1. In Adobe Photoshop, organize your file so that all your layers are “grouped” into individual folders, or that all the elements you want to import as a single layer in Harmony are grouped together in their own folder. Any layer that is not in a folder group, by itself or otherwise, will not be imported.

2. In Harmony, go to the top menu and select **File > Import > Images** or click the Import Images  button. The Import Images dialog box opens.

3. In the Files section, click **Browse** to find and select the **.psd** image on your computer.
4. In the Layer section, select the **Create Layer(s)** option, then select one of the following options:
 - **Create Single Layer Named:** Creates a new layer with the specified name and imports the images into it.
 - **Create Layer(s) Based on Filenames:** Creates a layer based on each unique filename prefix. For example, if you import three files named a-1.tga, a-2.tga and b-1.tga, this will create two layers, one named "a" and one named "b". Layer "a" will contain the two first images and "b" will contain the third one.
 - **Add to Existing Layer:** Imports the images into the specified layer. Note that you can only import into layers that are compatible with your import options. For example, if you're importing images as vector drawings, you can only import them into vector drawing layers.
5. Select the **Create Symbol for Imported Items** option if you want the layers to be contained in symbols.
6. In the Import Options section, select the following option to import your image as its original format.
 - **Keep As Original Bitmap:** Retains an imported image as a bitmap. In the Alignment section, decide on the size and placement of your image within the camera frame. Depending on the Scene Settings (the height and width in pixels that you chose for your project), an image that you import may get scaled to the point where all its individual pixels become visible.
7. Decide whether to select **Vectorize Imported Items** option.
8. Click **OK**.

The Multilayer Image Import Settings dialog box opens.

9. From the Create menu, select one of the following:
 - **Single Layer:** To import the Camera and Layout layers merged together.
 - **Separated Layers:** To keep your Camera and Layout layers separated.

10. From the Transparency menu, select one of Alpha option.

11. Click **OK**.

Your image appears as separate layers in the Timeline view, corresponding to the PSD layer group folders.

NOTE: The artwork displayed in every one of your layers as a result of a multilayer PSD file import is linked to the same source image. This means that if you use the **Drawing > Delete Selected Drawings** command to physically delete the drawing from the project folder, the exposed drawing will be deleted in all layers at once. Once deleted from the project folder, the image cannot be retrieved unless you reimport your psd file.

Importing PSD Layouts

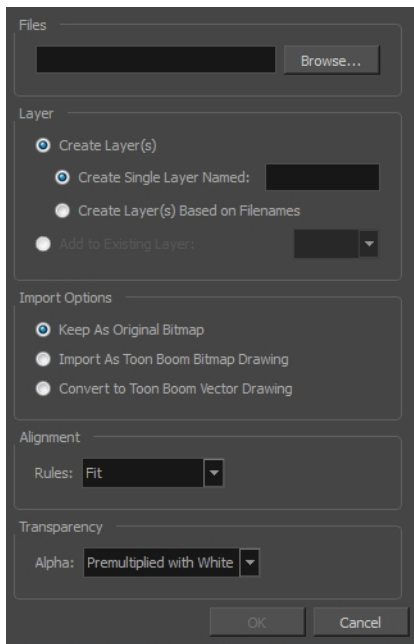

If you exported a Photoshop layout image from a Harmony project using the Export Layout Image function, you can easily import it back into Harmony, simply be sure to import it at the beginning of the project for accurate scene planning.

Harmony supports both .psd and .psb file formats.

How to import a PSD layout

1. In your Harmony project, select **File > Import > Images**.

The Import Images dialog box opens.

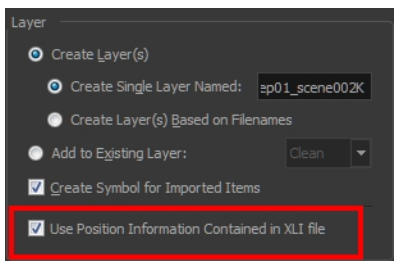

2. In the Files section, click **Browse** to find and select the .psd or .psb layout file on your computer. Note that this layout file must have its corresponding .xli file in the same folder.

3. Once you have selected the layout file, the Use Position Information Contained in XLI File option appears in the Layer section.

This option is enabled by default. When you import the layout image in your scene, it will be automatically positioned to fit the original layout scene creating an accurate layout guide. You can disable this option if you want the imported layout image to be imported according to the normal behaviour of the import process. The layout image will be incorrectly aligned as it was when it was first created.

4. In the Layer section, select the **Create Layer(s)** option, then select one of the following options:
 - **Create Single Layer Named:** Creates a new layer with the specified name and imports the images into it.
 - **Create Layer(s) Based on Filenames:** Creates a layer based on each unique filename prefix. For example, if you import three files named a-1.tga, a-2.tga and b-1.tga, this will create two layers, one named "a" and one named "b". Layer "a" will contain the two first images and "b" will contain the third one.
 - **Add to Existing Layer:** Imports the images into the specified layer. Note that you can only import into layers that are compatible with your import options. For example, if you're importing images as vector drawings, you can only import them into vector drawing layers.

5. Select the **Create Symbol for Imported Items** option if you want the layers to be contained in symbols.

6. In the Layer section, select the **Create Layer(s)** option, then select one of the following options:
 - **Create Single Layer Named:** Creates a new layer with the specified name and imports the images into it.
 - **Create Layer(s) Based on Filenames:** Creates a layer based on each unique filename prefix. For example, if you import three files named a-1.tga, a-2.tga and b-1.tga, this will create two layers, one named "a" and one named "b". Layer "a" will contain the two first images and "b" will contain the third one.
 - **Add to Existing Layer:** Imports the images into the specified layer. Note that you can only import into layers that are compatible with your import options. For example, if you're importing images as vector drawings, you can only import them into vector drawing layers.

7. Select the **Create Symbol for Imported Items** option if you want the layers to be contained in symbols.

8. In the Import Options section, select the following option to import your image as its original format.
 - **Keep As Original Bitmap:** Retains an imported image as a bitmap. In the Alignment section, decide on the size and placement of your image within the camera frame. Depending on the Scene Settings (the height and width in pixels that you chose for your project), an image that you import may get scaled to the point where all its individual pixels become visible.

9. Decide whether to select **Vectorize Imported Items** option.

10. Click **OK**.
The Multilayer Image Import Settings dialog box opens.

11. From the Create menu, select one of the following:

- **Single Layer:** To import the Camera and Layout layers merged together.
- **Separated Layers:** To keep your Camera and Layout layers separated.

12. From the Transparency menu, select an alpha option—see the Reference guide .

13. Click **OK**.

Your image appears as separate layers in the Timeline view, corresponding to the .psd layer group folders **Camera_Set** and **Layout_Set**. You can now use this layout as a guide for scene settings.

Importing QuickTime Movies

T-ANIMPA-004-002

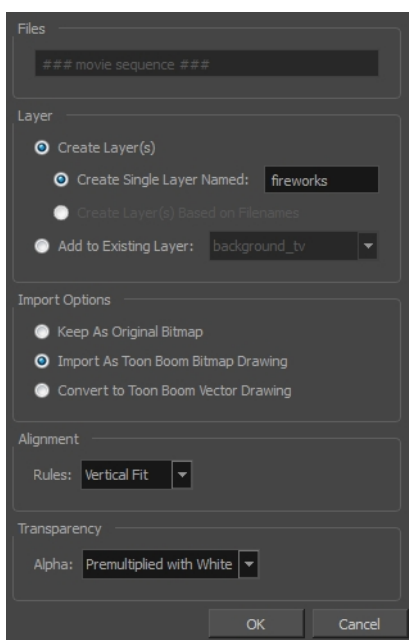

When creating an animation, it is not unusual to embed moving elements saved as videos within the animation. Toon Boom Harmony allows you to import QuickTime movies into your project.

How to import a QuickTime movie

1. From the top menu, select **File > Import > Movie**.
2. Browse for the QuickTime movie to import and click **Open**.

The Import Images dialog box opens.

NOTE: Do not browse for the movie file again. Leave the automatically generated field text as “many files selected”.

3. Make your decisions for the Layer, Alignment and Transparency sections of this dialog box—see the Reference guide .
4. Click **OK**.

The QuickTime video appears in the Timeline view as an image sequence. You can scroll through the film frame-by-frame just as you would scroll through your animation drawing-by-drawing.

About Scanning

Harmony can receive images from any TWAIN device, such as scanners or digital cameras. You can load these images as bitmaps into your scene or convert them into vector-based images that can be edited using Harmony.

You must install a TWAIN driver for your device in order to access its contents. Refer to the manufacturer of your device to get a TWAIN driver. Once all the animation layers are scanned in, you can set the timing in the digital exposure sheet.

Once your traditional animation sequences are completed and cleaned up, you're ready to scan and import them in Harmony. The scanning process is the point where the traditional production becomes digital. It's the moment where you use Harmony to control the project.

Scanning Images

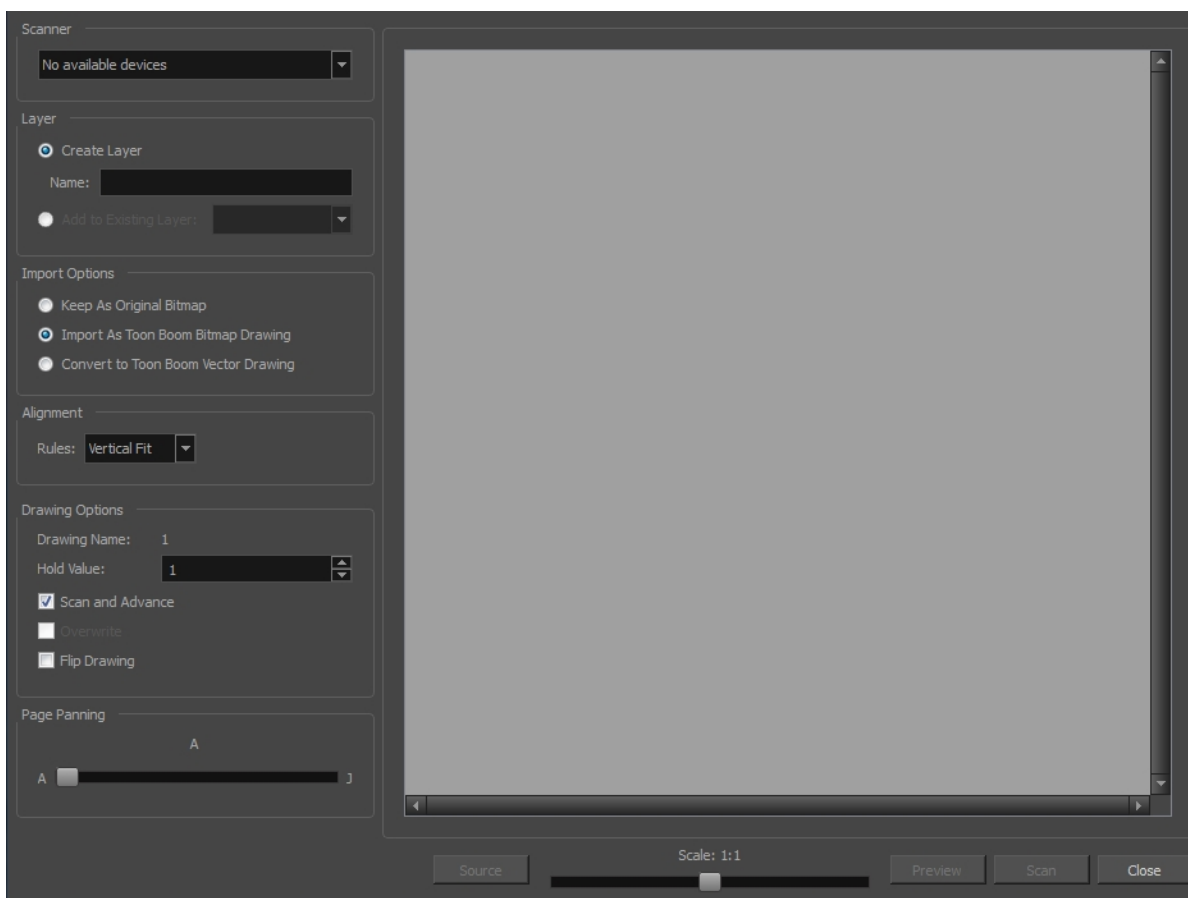

Toon Boom Harmony can receive images from any TWAIN device such as scanners and digital cameras. These images can either be loaded into your scene as bitmaps or converted into vector-based images that can be edited using Toon Boom Harmony.

If your operating system does not automatically recognize your device after it has been connected, you must install the correct TWAIN drivers in order to access its contents. You can usually download the drivers from the device manufacturer's website.

How to scan images

1. From the top menu, select **File > Import > From Scanner**.

The Scan Drawings window opens.

2. In the Scan Drawings window, select your scanner or other supported TWAIN device from the Scanner menu. If none are available, check your device to ensure that it's properly connected to your computer. If your device still does not appear in the menu, you may have to shut down and restart the software.
3. In the Layer section, decide if the scanned or imported image will be placed on a new layer or existing layer—see the Reference guide .
4. In the Import Options section, select the type of image you want to create—see the Reference guide .

5. In the Alignment section, decide on the size and placement of your scanned image within the camera frame. Depending on the scene settings (the height and width, in pixels, that you chose for your project), an image that you scan may be scaled to the point where all its individual pixels become visible—see the Reference guide .
6. In the Drawing Options section, set the following options if desired:

- **Drawing Name:** Name of the drawing to import.
 - **Hold Value:** Type the number of frames that the drawing will be exposed.
 - **Scan and Advance:** Lets you scan one drawing after another every time you click **Scan**.
 - **Flip Drawing:** Mirrors the drawings horizontally and scans it this way.
7. Adjust the **Scale** control and sliders in the Preview Image window until you are satisfied with the view.

8. Click **Scan** to scan your drawing.
9. If you are scanning panoramic drawings, in the Page Panning section, move the slider to the next letter to capture your next frame.

10. If you have more than one drawing, set the next drawing in place and click **Scan** again. Repeat until you have finished scanning all your drawings.

Vectorizing Scanned Drawings

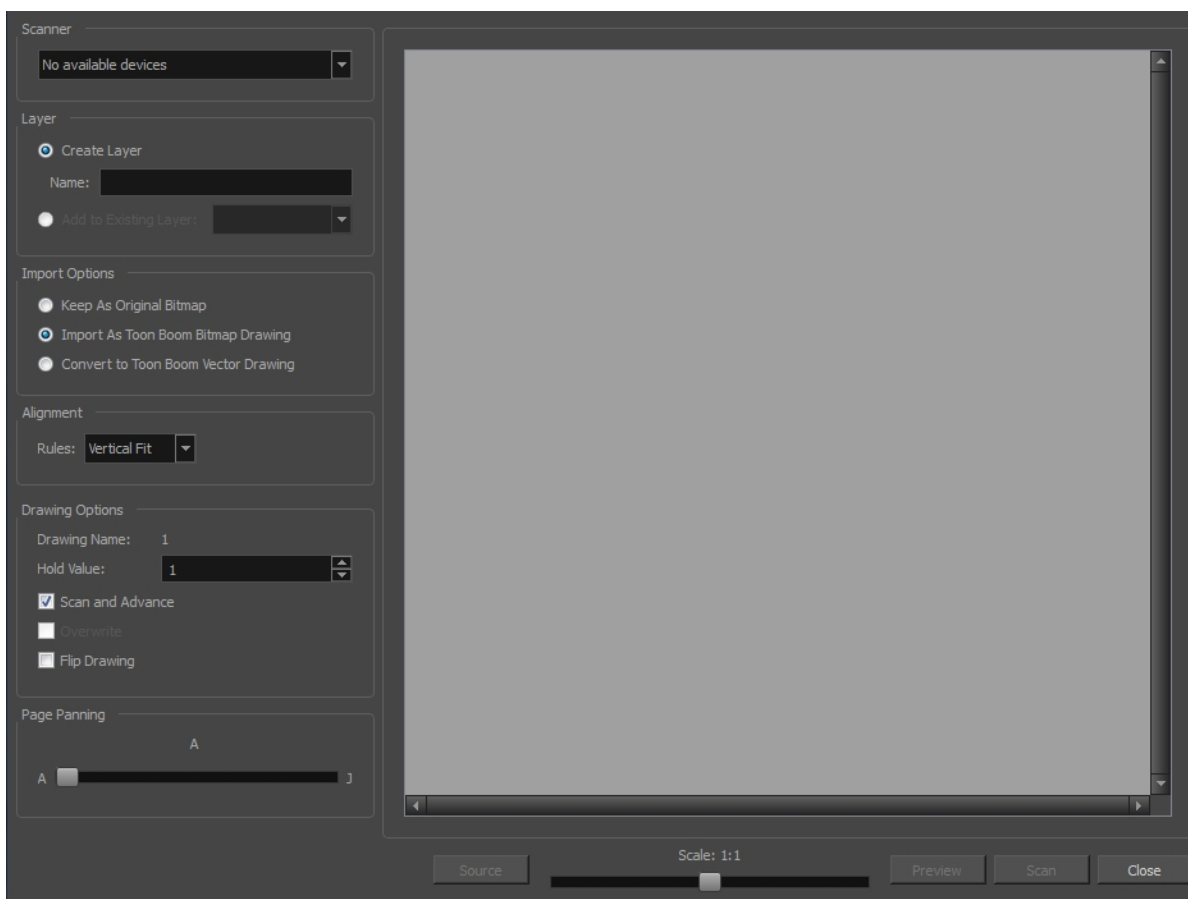

You can turn scanned images into vector drawings, while maintaining the sketchiness of a pencil line or into vector images with a bitmap fill. Both options can add life to an animation, which straight vectorization with smoothing does not usually afford.

How to scan and vectorize drawings

1. From the top menu, select **File > Import > From Scanner**.

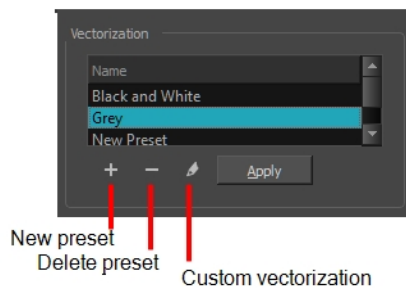

The Scan Drawings window opens.

2. Select your scanner from the Scanner list.

3. Click **Preview** to get a test scan of your drawing.
4. In the Layer section, select one of the following:
 - **Create Layer:** Imports an image into a new layer. Type a name for the layer in the **Name** field.
 - **Add to Existing Layer:** Imports the image into an existing layer. Select a layer from the Layer list.
5. In the Import Options section, select the **Convert to Vector Drawing** option.
6. In the Vectorization section, set the following:

- **Black and White:** Vectorizes drawings as a solid black line; creates a 100% vector-based drawing. Set the Threshold and Smooth parameters.
 - **Grey:** Vectorizes the image as a mix of vector contour and greyscale bitmap filling. Lines keep the texture from the scan, and the white of the paper becomes transparent.
 - **New Preset:** Lets you create a new preset.
 - **Delete Preset:** Lets you delete any preset in the list.
 - **Custom vectorization:** Lets you set custom vectorization parameters—see [About Custom Vectorization Parameters](#) on page 888.
7. In the Drawing Options section, set the following options if desired:

- **Drawing Name:** Name of the drawing to import.

- **Hold Value:** Type the number of frames that the drawing will be exposed.
- **Scan and Advance:** Lets you scan one drawing after another every time you click **Scan**.
- **Overwrite:** Lets you overwrite existing drawings—see [Vectorizing Scanned Drawings on page 885](#).
- **Flip Drawing:** Mirrors the drawings horizontally and scans it this way.

8. Adjust the **Scale** control and the sliders in the Preview Image window until you're satisfied with the view.

9. Click **Scan** to import your drawing.

10. If you are scanning panoramic drawings, in the Page Panning section, move the slider to the next letter to capture your next frame.

11. If you have more than one drawing, set the next drawing in place and click **Scan** again. Repeat until you have finished scanning all your drawings.

About Custom Vectorization Parameters

You can create your own vectorization settings with Harmony. The vectorization parameters you create can be saved, shared and also inserted into the `VectOptions.conf` file used by the Scan and Control Center modules when scanning or vectorizing a series of drawings.

You can use an interface to select and test the different options, as well as type in some advanced settings.

The Vectorization Parameters dialog box lets you vectorize pencil drawings, along with any red, blue or green pencil marks you may have used to indicate highlights and shadows. The drawing will be vectorized into pure red, blue, green and black (RGB values), while creating colour art zones wherever lines connect. After painting in your tones and highlights, change your pure RGB colours to transparent (0 Alpha) in the Colour Picker window and watch the indicator colour zone lines disappear.

Creating Vectorization Styles

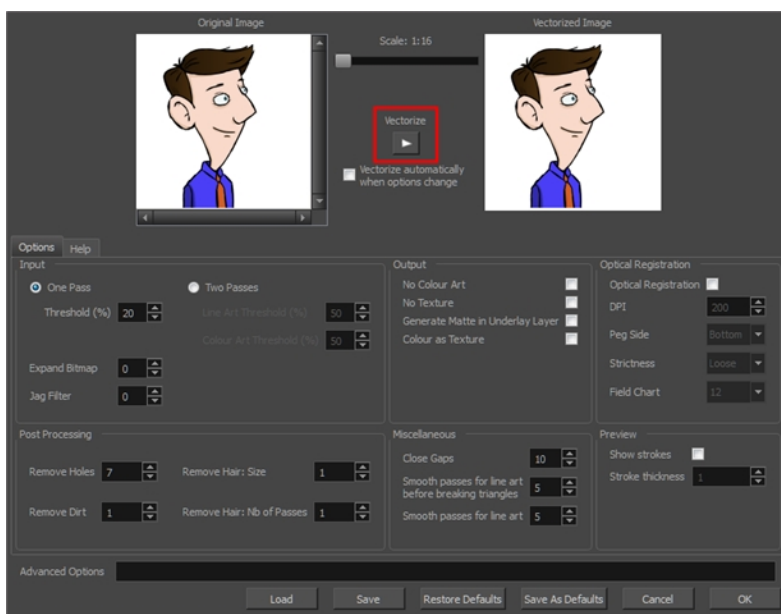

With Harmony, you can create custom vectorization parameters that can be saved, reused, shared, or used to set the Scan module vectorization style list.

You can vectorize drawings using one of the following methods:

- **Black and White:** All the lines become vector based and 100% black. The white areas become completely transparent.
- **Greyscale:** All the lines preserve their initial textured look in grey shades as a bitmap image contained inside a vector frame. The white areas become completely transparent.
- **Four Colours:** With the advanced parameters, you can isolate the red, green, blue, and black lines and turn them into 100% vector lines, preserving their original colours—see the Reference guide .

How to create or modify the vectorization parameters

1. From the top menu, select **File > Import > From Scanner**.
You can also open it from any other import option that allows you to customize the vectorization parameters (i.e. from the scanner).
2. In the Scan Drawings window, do the following:
 - In the Layer section, decide on the layer options.
 - In the Import Options section, select the **Convert to Toon Boom Vector Drawing** option
 - Click **Preview**.
3. In the Vectorization section, click the Vectorization Parameters  button.
4. The Vectorization Parameters dialog box opens.
5. Set the different options available in the Vectorization Parameters dialog box—see the Reference guide .

6. Click the **Vectorize** button to update the Vectorized Image preview.

The vectorized image is just a preview. The actual vectorization happens when you click **OK** in the Import Images dialog box. There are many options to try in the Vectorization Parameters dialog box. These are applied during the vectorization process.

7. To set advanced parameters, read the information on the Help tab, then type in the Advanced Options field at the bottom of the dialog box.
8. To save your vectorization parameters to reuse them later, share them, or use them to set the Scan module vectorization style list, click **Save**.
9. In the Browser window, name and save the file.

10. To save the current settings as your default settings, click **Save As Default**. To restore the default settings, click **Restore Defaults**.
11. To load a vectorization style, click **Load** and locate the existing *.vof file.
12. Click **OK**.

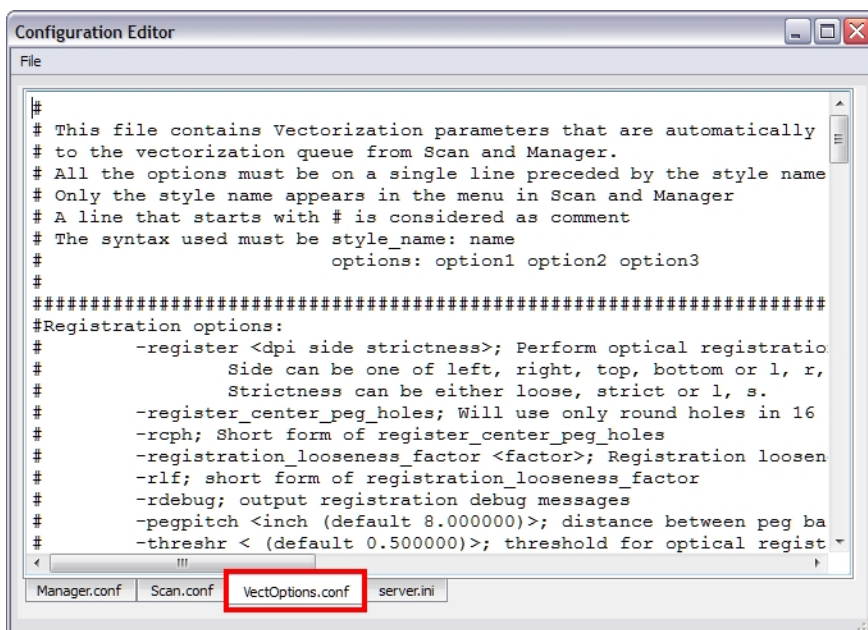

Setting the VectOptions.conf File

Toon Boom Harmony Server uses a file called `VectOptions.conf` to get the vectorization style when batch vectorizing a series of drawings. A series of default styles is available in this file, but you will certainly want to create your own to fit your production style.

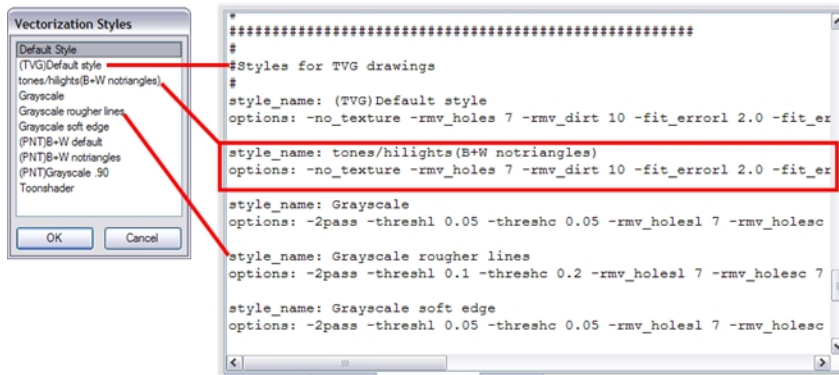

How to set the VectOptions.conf file on Windows or Mac OS X

1. Open the `vectOptions.conf` file:
 - Windows: Select **Programs / All Programs > Harmony 14 > Tools > Configuration Editor**.
 - Mac OS X: Select **Applications > Harmony 14 > Tools > Configuration Editor**.

The Configuration Editor window opens.

2. In the bottom section of the window, select the **VectOptions.conf** tab.
3. Scroll down the `VectOptions.conf` file to see all the different options available for creating your custom vectorization style. These options are the same as in the Vectorization Parameters dialog box. It is recommended that you create your vectorization style using Harmony and the Vectorization Parameters window and copy the result parameters in this file—see [About Custom Vectorization Parameters](#) on page 888
4. Scroll down toward the bottom of the file to see the default styles. You can modify them or add new ones to the list using the parameters you got using the Vectorization Parameters window. Notice that some of the lines have a “#” sign at the beginning to indicate that the line is a comment and will not appear in the style list. The lines that have no sign at the beginning appear in the style list.

- To create a new style, type the following below the existing styles:

style_name:

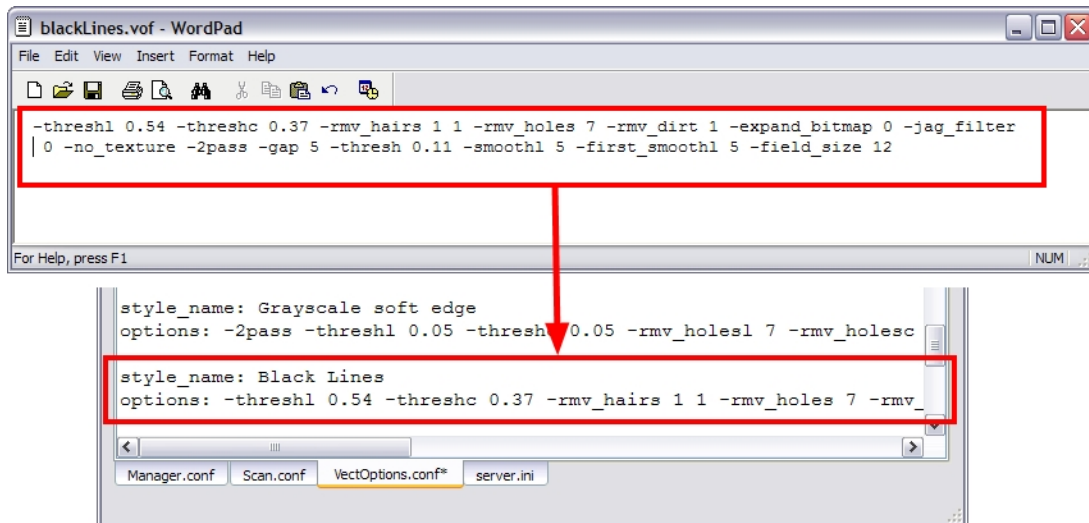

This should be followed by the name of your new style. For example: **style_name: Black Lines.**

- Under the style name line, type the following:

options:

- Copy and paste the information in your *.vof style when saving your settings in the Vectorization Parameters window.

- ▶ To open the *.vof file, use any plain text editor application.

- In the Configuration Editor's top menu, select **File > Save**.
- If you have Toon Boom Harmony Scan on your computer, you can start the application and verify that the new style appears in the Vectorization Style list under **Edit > Vectorization Style**.

NOTE:

If you are using the batch processing method available with Toon Boom Harmony Server to scan and vectorize drawings, the selected style must be available on all the machines included in the batch processing list.

Refer to the Harmony Server Guide Guide to learn more about setting up and using batch processing.

How to set the VectOptions.conf file on Linux using the vi text editor

1. Open a Terminal window:
Menu: **Applications > System Tools > Terminal**
2. Open the etc folder inside the installation directory:

```
$ cd /usr/local/ToonBoomAnimation/harmony_14/etc
```
3. Change your user to "root":

```
$ su
```

 - ▶ If your user is part of the sudoers list, enter the following command and go to step 5.

```
$ sudo vi VectOptions.conf
```
4. Enter the root password.
5. Open the VectOptions.conf file:

```
$ vi VectOptions.conf
```
6. To start editing, press **I** to enter Insert mode.
7. When you're finished editing the file, press **Esc** to exit Insert mode.
8. To save the changes made to the file, type the following and press Enter/Return:

```
$ :w!
```
9. To exit the vi editor and return to the Terminal, type the following and press Enter/Return:

```
$ :q
```

- If you have Toon Boom Harmony Scan module on your computer, start the application and verify that the new style appears in the Vectorization Style list under **Edit > Vectorization Style**.

NOTE:

If you are using the batch processing method available with Toon Boom Harmony Server to scan and vectorize drawings, the selected style must be available on all the machines included in the batch processing list.

Refer to the Harmony Server Guide Guide to learn more about setting up and using batch processing.

How to set the VectOptions.conf file on Linux using the gedit text editor

- Open a Terminal window:
Menu: **Applications > System Tools > Terminal**
- Open the `etc` folder inside the installation directory:

```
$ cd /usr/local/ToonBoomAnimation/harmony_14/etc
```
- Change your user to "root":

```
$ su
```

 - If your user is part of the sudoers list, enter the following command and go to step 5.

```
$ sudo gedit VectOptions.conf
```
- Enter the root password.
- Open the `VectorOptions.conf` file:

```
$ gedit VectOptions.conf
```
- Edit the parameters of the `VectorOptions.conf` file as you would do in most text editor applications.
- Select **File > Save**.
- Select **File > Quit**.

- If you have Toon Boom Harmony Scan module on your computer, start the application and verify that the new style appears in the Vectorization Style list under **Edit > Vectorization Style**.

NOTE:

If you are using the batch processing method available with Toon Boom Harmony Server to scan and vectorize drawings, the selected style must be available on all the machines included in the batch processing list.

Refer to the Harmony Server Guide Guide to learn more about setting up and using batch processing.

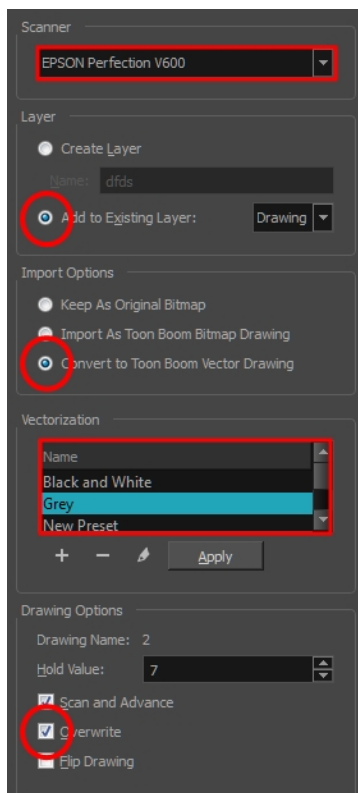

Overwriting Using Scanned Drawings

At times, it might be more efficient to create a scene and fill in the exposure sheet before scanning. Then you can simply scan your drawings to fill in the necessary cells in the exposure sheet. Note that when you start scanning, the drawings are named sequentially regardless of whether there is an exposure or not in the Xsheet.

How to overwrite existing drawings

1. In the Xsheet, select the first cell to overwrite.
2. From the top menu, select **File > Import > From Scanner**.
3. In the Scan Drawings window, do the following:
 - **Scanner:** Select your scanner from the list.
 - **Layer:** Select the **Add to Existing Layer** option.
 - **Import Options:** Select the **Convert to Toon Boom Vector Drawing** option.
 - **Vectorization:** Select an appropriate option: Black and White or Grey, or create a new preset.
 - **Drawing Options:** Select the **Overwrite** option.

4. Click **Preview**.

The scanner window opens.

5. Make any necessary adjustments to the image before scanning, then click **Preview**.
6. In the Scan Drawings window, click **Scan**.

The scanned drawing replaces the selected cell in the Xsheet, filling the entire exposure. The Drawing Options section indicates the name of the cell the drawing overwrote and its exposure value.

Chapter 15: Staging

Setting up your scene can be compared to building a set for a television show. This is the point when you position each scene element such as the camera frame, the background elements and the characters.

To learn how to position and animate your camera, see [Cameras on page 1021](#).

About Layer Position

Setting up the scene also involves positioning the different scene elements within the camera frame.

At this time, the elements are set to a static position. See [Motion Paths on page 955](#) to learn how to animate the elements and the camera.

About the Animate Mode

T-HFND-008-001

The Animate mode records the position, rotation, scale, skew, etc. of objects as keyframes in the Timeline view. Turn off the Animate mode to reposition objects for the entire scene. When the Animate mode is disabled, keyframes are not created when an object's parameters change.

When positioning elements, make sure the Animate Mode is turned off, or it will create a keyframe on your drawing layer. The animate mode is used to animate layers over time.

Animate mode is on.
(Pushed in)

Animate mode is off.

How to turn the Animate mode on or off

1. In the Tools toolbar, click the Animate  button or select **Animation > Animate**.

Selecting Layers

There are different ways to select the layers you want to reposition.

You can select your elements directly in the Camera view using the Transform tool. When using this tool, its properties and options appear in the Tool Properties view. Always make sure that the Peg Selection Mode option in the Tool Properties view is disabled or it will limit the selection to pegs only.

How to select a layer in the Camera view

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. In the Tool Properties view, make sure that the Peg Selection Mode  is deselected.
3. In the Camera view, click on the element to be repositioned. You can select more than one element at a time. Hold down Shift while clicking on the elements to be selected.

The corresponding layers and columns are highlighted in the Timeline and Xsheet views.

How to select from the Timeline or Xsheet view

- In the Timeline view, click the layer corresponding to the element you want to reposition.
- In the Xsheet view, click the column header corresponding to the element you want to reposition.

The selected element is highlighted in the Camera view.

How to select non-adjacent elements in the Timeline or Xsheet view

- In the Timeline view, hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click on any layers that you would like to add to the selection.
- In the Xsheet view, hold down Ctrl (Windows/Linux) or ⌘ (Mac OS X) and click on any columns that you would like to add to the selection.

The non-adjacent, selected layers and columns are highlighted in the Timeline and Xsheet views.

How to select all elements within a group in the Timeline view

1. With a group collapsed or expanded, hold down Alt and click on the group in the Timeline view.

All elements contained within the group are selected.

Setting Bounding Box Styles

You can change the display style of selected elements to a bounding box style. This removes the default overlay highlight and leaves only the bounding box around the selected element.

How to set the bounding box selection style

1. In the Camera view bottom toolbar, click the BBox Selection Style  button.

Centering on Selections

When you have many layers in the Timeline view, you may find it hard to locate which one is selected. You can use the Centre on Selection feature to display the selected object's layer in the Timeline view.

How to center on the selected layer in the Timeline view

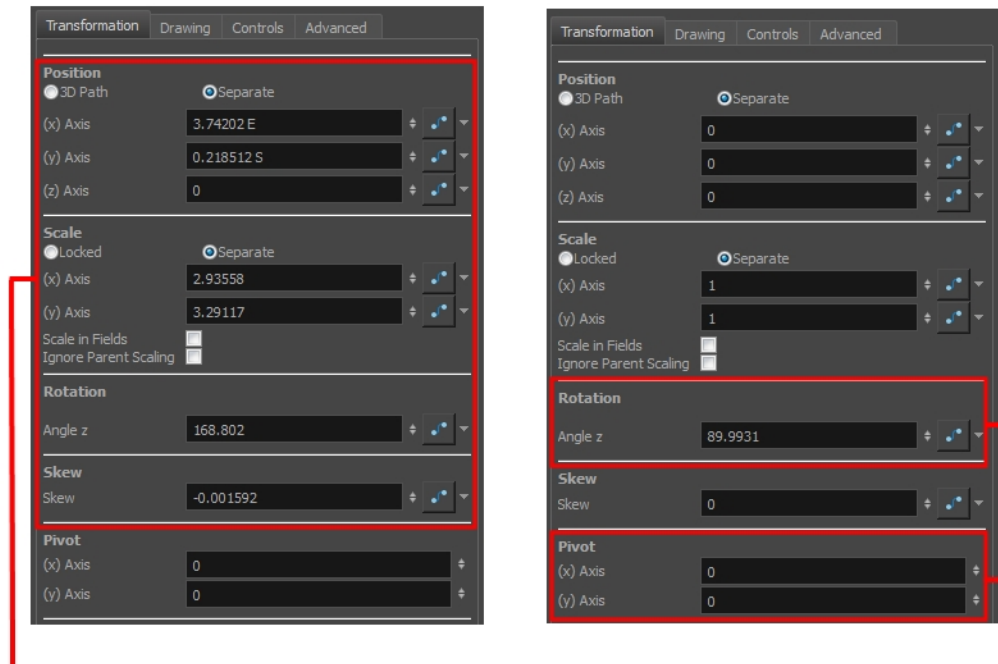

1. In the Camera view, select a layer.
2. Do one of the following:
 - From the Timeline view menu, select **View > Centre on Selection** or press O.
 - In the Timeline view toolbar, click the Centre on Selection  button.

About the Transform Tool

T-HFND-008-003

Using the Transform tool, you can easily reposition, scale, rotate and even skew layers directly in the Camera view.

When positioning a drawing layer using the Transform tool, always make sure the Peg Selection Mode  is deselected in the Tool Properties view. Otherwise, it will limit the selection to pegs in the Camera view.

The Transform tool can affect the Position, Scale, Rotation, and Skew parameters, but not the Pivot parameter.

The Rotation tool only affects the Rotation and Pivot parameters.

There are two different options you can use when you want to flip your element.

The Flip Horizontal and Flip Vertical options let you flip a drawing layer along the Camera view's horizontal and vertical axis.

Once your drawing layer is rotated, the original horizontal and vertical axes change. The Flip Scale X and Flip Scale Y will perform a flip on your drawing layer following its original axis.

- The Flip Horizontal command flips the layer following the Camera view X-axis.
- The Flip Scale X command uses the original X-axis of the layer and flips the element following it.

The Flip Horizontal command flips your drawing based on its position in the Camera view and its pivot.

The Flip Scale X command remembers the original X-axis of the layer and flips the element following it.

Repositioning Temporary Pivots with the Transform Tool

T-HFND-008-004

Transformations, such as rotation, scale, skew and flip are made relative to the pivot point position. You can temporarily reposition the pivot point for each transformation using the Transform tool. Note that the pivot is only moved temporarily. When animating the position, the interpolation is calculated from the permanent pivot position—see [About Advanced Animation Tools on page 914](#).

How to temporarily reposition the pivot point

1. In the Tools toolbar, select the Transform  tool.
2. In the Tool Properties view, make sure the Peg Selection Mode  is disabled.
3. In the Camera view, select your element.

The pivot point appears at the center of the scene space (coordinates 0, 0, 0), unless previously repositioned.

4. Click on the pivot point and drag it to a new position.

This will be the new position of the pivot point for the current transformation. It will remain in this position as long as you do not deselect the drawing. Using the Transform tool to reposition your pivot will temporarily override the existing pivot point position until you complete the current transformation. Then it returns automatically to its original position.

When you translate the pivot point using the Transform tool, the permanent pivot will appear as a ghost so you know where it is and also from where the animation will be interpolated when you create motion paths. The animation is always interpolated from the original pivot and not the temporary pivot.

Panning with the Transform Tool

T-HFND-008-005

You can pan (translate) a layer using the Transform tool.

How to pan a layer using the Transform tool

1. In the Tools toolbar, disable the Animate  mode.
2. In the Tools toolbar, select the Transform  tool or press Shift + T.
3. In the Tool Properties view, make sure the Peg Selection Mode  is deselected.
4. In the Camera view, select a drawing layer and drag the selection to a new area. You can select multiple layers to reposition them at the same time. Hold down Shift and select the different layers.

Rotating with the Transform Tool

T-HFND-008-006

You can rotate a layer from its pivot using the Transform tool. You can temporarily reposition the pivot to rotate from a different point.

How to rotate a layer using the Transform tool

1. In the Tools toolbar, disable the Animate  mode.
2. In the Tools toolbar, select the Transform  tool or press Shift + T.
3. In the Tool Properties view, make sure the Peg Selection Mode  is deselected.
4. In the Camera view, select a drawing layer.
5. Place the pointer outside of a corner of the bounding box and drag to rotate.

NOTE: You can display a rotation handle on the bounding box when transforming a layer. In the Preferences dialog box, select the Camera tab and then select the **Use Rotation Lever with Transformation Tools** option. This preference is off by default.

Scaling with the Transform Tool

T-HFND-008-007

You can scale a layer from its pivot using the Transform tool. You can temporarily reposition the pivot to scale from a different point.

How to scale a layer using the Transform tool

1. In the Tools toolbar, enable or disable the Animate  mode if you want to animate or not.
2. In the Tools toolbar, select the Transform  tool or press Shift + T.
3. In the Tool Properties view, make sure the Peg Selection Mode  is deselected.
4. In the Camera view, select a drawing layer and push or pull on the size, top, or corner control point. Hold down Shift to lock the selection's aspect ratio.

NOTE: When scaling your selection, you can hold down Shift to preserve its aspect ratio.

Skewing with the Transform Tool

T-HFND-008-008

You can skew a layer from its pivot using the Transform tool. You can temporarily reposition the pivot to skew from a different point.

How to skew a layer using the Transform tool

1. In the Tools toolbar, disable the Animate  mode.
2. In the Tools toolbar, select the Transform  tool or press Shift + T.
3. In the Tool Properties view, make sure the Peg Selection Mode  is deselected.
4. In the Camera view, select a drawing layer.
5. Place the pointer between two controls points and drag sideways or up and down.

Flipping with the Transform Tool

T-HFND-008-009

You can flip a layer using the Transform tool. There are two ways to flip.

- The Flip Horizontal command flips the layer following the Camera view X-axis.
- The Flip Scale X command uses the original X-axis of the layer and flips the element following it.

How to flip a layer

1. In the Tools toolbar, disable the Animate  mode.
2. In the Tools toolbar, select the Transform  tool or press Shift + T.
3. In the Tool Properties view, make sure the Peg Selection Mode  is deselected.
4. In the Camera view, use the Transform  tool to select a drawing layer to flip.
5. Do one of the following:
 - From the top menu, select **Animation > Flip > Flip Horizontal** or **Flip Vertical**.
 - In the Tool Properties view, click the Flip Horizontal  and the Flip Vertical  buttons.
 - Press 4 or 5.

How to flip an element following its original axis

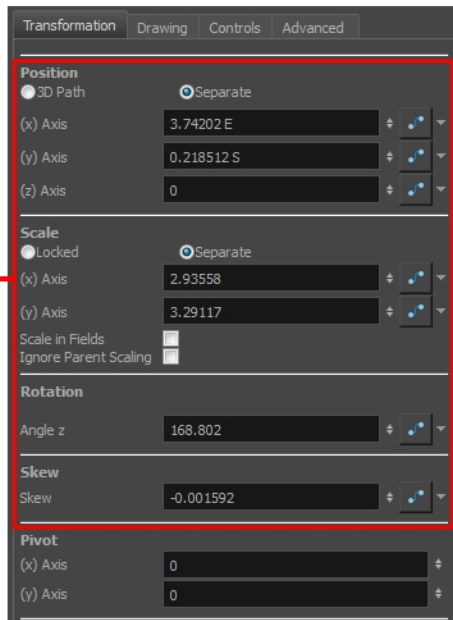

1. In the Tools toolbar, disable the Animate  mode.
2. In the Tool Properties view, make sure the Peg Selection Mode  is deselected.
3. In the Camera view, use the Transform  tool to select an element that has already been transformed.
4. From the top menu, select **Animation > Flip > Flip Scale X** or **Flip Scale Y**.

About Advanced Animation Tools

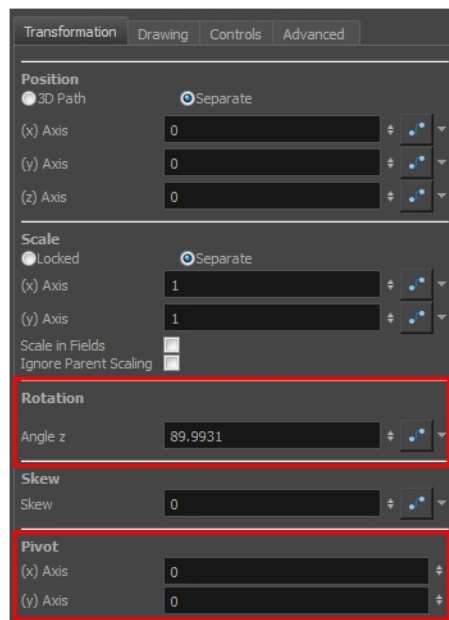

T-HFND-008-010

You can also use the advanced animation tools to position your layers. The difference between these tools and the Transform tool is that they modify only one parameter of the position such as the rotation or the scale as the Transform tool adjusts all parameters together.

You can find the advanced animation tools in the Advanced Animation Tools toolbar.

The Transform tool can affect the Position, Scale, Rotation, and Skew parameters, but not the Pivot parameter.

The Rotation tool only affects the Rotation and Pivot parameters.

Repositioning Permanent Pivots

Transformations made on a drawing layer, such as rotation, scale, skew and flip, are made relative to the position of the drawing's pivot point. While making transformations using the Transform tool, you can drag and drop your selection's pivot. However, this has no permanent effect. It will only temporarily change the pivot's position to help you make transformations at the selected frame, but the actual pivot point of your drawing layer will remain the same. You can reposition a layer's pivot point permanently using the advanced animation tools.

How to permanently reposition the pivot point

1. In the Advanced Animation toolbar, select the Translate , Rotate , Scale , or Skew  tool.
2. In the Camera view, Ctrl + click (Windows/Linux) or  + click (Mac OS X) to select your element.

The pivot point appears in the Camera view.

3. Drag the pivot point to a new position.

NOTE: When you permanently move the pivot point, of a layer that is already animated, all the transformations done on the layer on other keyframes will be recalculated according to the new pivot point's position. Therefore, your existing animation will look completely different, except at the current frame. It is recommended to always make sure your pivot point is at its ideal position before you start animating.

Using the Translate Tool

You can use the Translate tool to pan your elements on the X, Y and Z axes.

How to use the Translate tool

1. In the Tools toolbar, disable the Animate  mode.
2. Do one of the following:
 - From the top menu, select **Animation > Tools > Translate**.
 - In the Advanced Animation toolbar, click the Translate  tool.
 - Press Alt + 2.
3. In the Camera view, Ctrl + click (Windows/Linux) or  + click (Mac OS X) to select your element.
4. Drag the selection to a new area.

- You can select multiple layers at the same time. Press Ctrl + Shift + click (Windows/Linux) or  + Shift + click (Mac OS X) on each element to select them.

Using the Rotate Tool

You can use the Rotate tool to rotate your objects on the x,y and z axis.

How to use the Rotate tool

1. In the Tools toolbar, disable the Animate  mode.
2. Do one of the following:
 - From the top menu, select **Animation > Tools > Rotate**.
 - In the Advanced Animation toolbar, click the Rotate  tool.
 - Press the Alt + 3.
3. In the Camera view, Ctrl + click (Windows/Linux) or  + click (Mac OS X) to select your element.
4. Rotate the layer.

- You can select multiple layers at the same time. Press Ctrl + Shift + click (Windows/Linux) or  + Shift + click (Mac OS X) on each element to select them.

Using the Scale Tool

You can use the Scale tool to squash, stretch, and resize your elements.

How to use the Scale tool

1. In the Tools toolbar, disable the Animate  mode.
2. Do one of the following:
 - From the top menu, select **Animation > Tools > Scale**.
 - In the Advanced Animation toolbar, click the Scale  tool.
 - Press Alt + 4.
1. In the Camera view, Ctrl + click (Windows/Linux) or  + click (Mac OS X) to select your element.
3. Pull or push either on the side, top or corner control point. Hold down Shift to lock the selection's ratio when using the corner control points.

- You can select multiple layers at the same time. Press Ctrl + Shift + click (Windows/Linux) or  + Shift + click (Mac OS X) on each element to select them.

Using the Skew Tool

You can use the Skew tool to distort your elements on the x and y axis.

How to use the Skew tool

1. In the Tools toolbar, disable the Animate  mode.
2. Do one of the following:
 - Select **Animation > Tools > Skew**.
 - In the Advanced Animation toolbar, click the Skew  tool.
 - Press Alt + 5.
3. In the Camera view, Ctrl + click (Windows/Linux) or  + click (Mac OS X) on the element to select it and drag a side of the bounding box up, down or sideways.

- You can select multiple layers at the same time. Press Ctrl + Shift + click (Windows/Linux) or  + Shift + click (Mac OS X) on each element to select them.

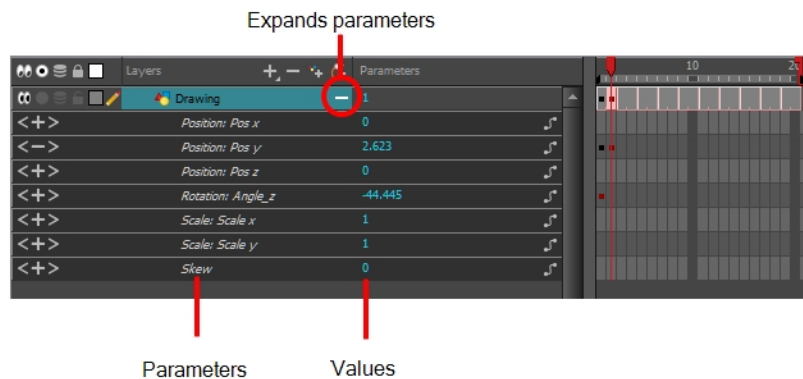

About the Layer Properties View

T-HFND-008-011

Each layer has a series of parameters that you can modify to adjust an element's position. You can access these parameters in the Layer Properties view. In this view, you can type in a value instead of moving the object in the Camera view. These values can also be animated over time.

NOTE: To learn more about the layer parameters, see the Reference guide .

You can also access a layer's parameters in the Timeline view. Click on the Expand Parameters **+** button.

It is important to understand the coordinate values in Harmony, which is based on the origins of animation. In traditional animation, a scene's size and camera motion are calculated in fields. A field has a 4:3 ratio and measures 0.5 inches (12.7 mm) in width. A specific grid has been created for this purpose known as a *field chart*. Harmony uses this unit of measurement as its coordinate system.

A field chart uses the cardinal directions. The X axis is the east-west (left-right) direction, the Y axis is the north-south (up-down) direction and the Z axis is the forward-backward direction.

In Harmony, a drawing's pivot is located at the centre of the field chart, regardless where your drawing has been drawn on the page. Your drawing is the entire sheet of paper, not only the drawing strokes you have drawn on the page. This allows scanned drawings, imported images and paperless drawings to be properly registered together.

If you want to move your drawing in the upper-left region of the camera frame, you would type in something like the following:

- X Axis: -4 or 4W (4 West)
- Y Axis: 5 or 5N (5 North)

If you want to move your drawing in the lower-right region of the camera frame, you would type in something like the following:

- X Axis: 3 or 3E (3 East)
- Y Axis: -2 or 2S (2 South)

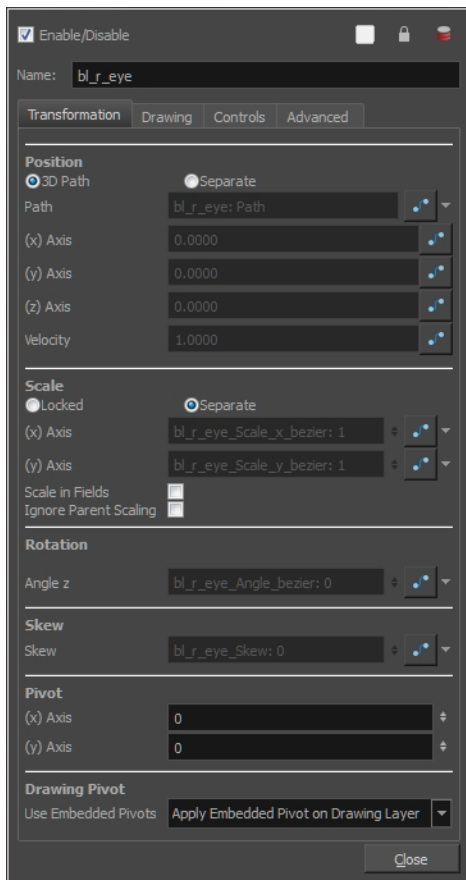

Displaying the Layer Properties View

You can display the Layer Properties view in several ways.

How to display layer parameters

1. Do one of the following:
 - In the Layer Properties view is not part of your workspace, from the top menu, select **Windows > Layer Properties**. In the Timeline view, select a layer
 - In the Timeline view, double-click on a layer.
 - Press Shift + E.

The properties display—see Element/Drawing Node in the Reference guide .

Positioning Elements with the Layer Properties View

T-HFND-008-012

You can type values to position your elements using exact coordinates.

NOTE: To learn more about the layer parameters, see the Reference guide .

How to position an element with coordinates

1. In the Timeline view, select a layer.
2. In the Position section, select one of the following options:
 - **Separate** to independently edit the different coordinate fields. Continue to step 3.
 - **3D Path** to use a 3D path function when animating your element. Continue to step 4.

3. In the (x), (y) and (z) Axis fields, type in a new coordinates corresponding to the desired position—see [About Multiplane on page 933](#).

As you type in values, the element's position is updated in the Camera view.

4. Use the Function  buttons to create function curves and add keyframes to animate the parameter.
5. In the Scale section, select one of the following options:
 - **Locked** to resizes the element uniformly in three directions.
 - **Separate** to resize the element in any direction without affecting the others.

6. In the (x) and (y) Axis fields, type in a new coordinates corresponding to the desired position
7. Use the Function  buttons to create function curves and add keyframes to animate the parameter.
8. In the Rotation section, Angle z field, type in a degree value for the rotation angle. Note that you can enter values greater than 360 and -360 degrees. If you enter 720, the object will rotate twice.

9. In the Skew field, type in a degree value between -90 to 90 for the skew angle.

10. In the Pivot section, type in the desired coordinate value to reposition the transformation pivot. This will change the permanent position of the pivot.

For detailed information on the Layer Properties parameters, see the Reference guide .

About Selection Locking

You can prevent correctly positioned layers from being selected in the Camera view by locking them in the Timeline view. This is useful for making a multiple selection inside the Camera view while avoiding to select them. Once a layer has been locked, its locked state will be remembered the next time you open a saved project.

You can perform five types of locking actions on your layers:

- The Lock  option lets you lock Locks one or a multiple selection of layers.
- The Unlock  button lets you unlock Unlocks one or a multiple selection of locked layers.
- The Lock All  option lets you lock Locks all the layers in the Timeline view.
- The Unlock All  button lets you unlock Unlocks all the layers in the Timeline view.
- The Lock All Others  button lets you lock Locks every layer except the selected ones.

Locking Layers

You can perform five types of locking actions on your layers. You will still be able to modify locked layers in the Timeline and Layer Properties views, but you will not be able to select them through the Camera view.

How to lock a layer or a selection of layers

1. In the Timeline view, select one or more layers.

2. Do one of the following:

- From the top menu, select **Animation > Lock > Lock**.
- Click one of the selected layer's Lock  icon.
- Press **Ctrl + Alt + L** (Windows/Linux) or **⌘ + Alt + L** (Mac OS X).

All selected layers are locked.

How to unlock a locked layer or a selection of locked layers

1. In the Timeline view, select one or more locked layers.

2. Do one of the following:

- From the top menu, select **Animation > Lock > Unlock**.
- Click a selected layer's Lock  icon.
- Press Ctrl + Shift + K (Windows/Linux) or ⌘ + Shift + K (Mac OS X).

All selected layers are unlocked.

How to lock all layers

1. Do one of the following:
 - From the top menu, select **Animation > Lock > Lock All**.
 - In the Timeline view, select all layers and click Lock  icon of a selected layer.
 - Press Ctrl + Shift + L (Windows/Linux) or ⌘ + Shift + L (Mac OS X).

All layers are locked.

How to unlock all layers

1. Do one of the following:
 - From the top menu, select **Animation > Lock > Unlock All**.
 - In the Timeline view, select all layers (locked) and click Lock  icon of a selected layer.
 - Press Ctrl + Alt + Shift + L (Windows/Linux) or ⌘ + Alt + Shift + L (Mac OS X).

All layers are unlocked.

How to lock all other layers

1. In the Timeline view, select the layers you do not want to lock.

2. Do one of the following:

- From the top menu, select **Animation > Lock > Lock All Others**.
- Press **Ctrl + Alt + Shift + O** (Windows/Linux) or **⌘ + Alt + Shift + O** (Mac OS X).

All layers are locked except the selected ones.

How to display locked drawings as outline

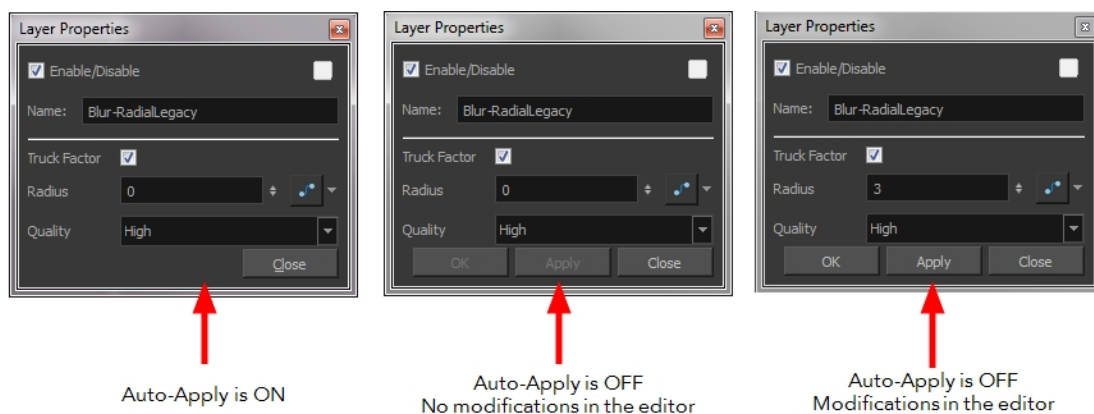

1. In the Camera View bottom toolbar, enabled the Outline Locked Drawings  option.
2. You can also set this option as a permanent preference. From the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
3. In the Preferences dialog box, select the **Camera** tab.
4. In the Tools section, select the **Show Locked Drawings As Outlines** option.

About Auto-Apply

When you modify a parameter in a property dialog box, Automatically applies changes you make to a property window or dialog box. Harmony applies the modification automatically and displays the result in the Camera view. When working on a heavy scene, it is useful to turn off this option. If you want to always work in Auto-Apply mode, you can deselect the Auto-Apply option in the Preferences dialog box (General tab). Then, each time you start Harmony, the Auto-Apply mode will be off. You must click the Apply button to see any modifications.

When you disable this function, Apply and OK buttons are added at the bottom of the Layer Properties view and any other parameter dialog boxes.

- Click **Apply** to apply the current change.
- Click **OK** to apply the current change and close the Layer Properties.

Setting the Auto-Apply Option

If you want to always work in Auto-Apply mode, you can deselect the Auto-Apply option in the Preferences dialog box (General tab). Then, each time you start Harmony, the Auto-Apply mode will be off. You must click the Apply button to see any modifications.

How to enable or disable the Auto Apply option

- From the top menu, select **Edit > Auto-Apply**.

How to enable or disable the Auto-Apply preference

1. In the top menu, select **Edit > Preferences** (Windows/Linux) or **Harmony Advanced > Preferences** (Mac OS X).
The Preferences dialog box opens.
2. In the Preferences dialog box, select the **General** tab.
3. In the Options section, select or deselect the **Auto Apply** option.

Resetting Transformations

You can easily reset layers to their original position. With the Reset command, you can return the value of a selected element to the initial value of the active tool. For example, if the Rotate  tool is active, the transformation angle will be reset to 0 and if the Transform  tool is active, the all transformation parameters values will be reset.

When selecting elements in the Camera view using the Transform tool, always make sure that the Peg Selection Mode  is deselected in the Tool Properties view. Otherwise, it will limit the selection to pegs only.

How to reset the transformation on the current frame

1. In the Tools toolbar, select the Transform  tool or any Advanced Animation  tool.
2. In the Timeline view or directly in the Camera view, select the drawing layer(s) to reset.
3. From the top menu, select **Animation > Reset** or press R. This will reset the current frame if keyframes were created.

The selected layer(s) return to their original position.

How to reset all transformations on the current frame

1. In the Tools toolbar, select the Transform  tool or any Advanced Animation  tool.
2. In the Timeline view or directly in the Camera view, select the drawing layer(s) to reset.
3. From the top menu, select **Animation > Reset All** or press Shift + R.

The selected layer(s) return to their original position.

How to reset all transformation values except Z

1. In the Tools toolbar, select the Transform  tool or any Advanced Animation  tool.
2. In the Timeline view or directly in the Camera view, select the drawing layer(s) to reset.
3. From the top menu, select **Animation > Reset All Except Z**.

All values except for those set on the Z axis are reset.

How to completely reset the layers' parameters

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. In the Timeline or Camera view, select one or more drawing layers to reset.
3. Do one of the following:
 - Right-click the selected layers and select **Clear All Values**. This will remove all keyframes and reset all values for the entire layer.

- In the Timeline View menu, select **Layers > Clear All Values**. This will remove all keyframes and reset all values for the entire layer.

The selected layers return to their original position.

About Multiplane

T-HFND-008-013

One of the most exciting features in Harmony is the multiplane or Z-depth. In the multiplane, you can create backgrounds in several layers, spread them on the Z-axis to add depth, and then move the camera through this environment to create an impressive perspective illusion.

In live action, when the camera moves through the scene, objects near the camera will move by a greater distance than objects far from the camera. In 2D animation, multiplanes can be used to achieve a similar effect without resorting to 3D backgrounds.

In Harmony, a multiplane can be easily achieved by creating a scene's background over several layers, and positioning them at different depths relative to the camera.

Before creating a multiplane, make sure you have a proper understanding of the environment in which your scene happens. Picture what your scene's background would be like in 3D, then imagine the camera moving through the space, and how the objects in the picture move at different speeds depending on where they are in relation to the camera lens.

In the following example, the background is made of 6 different layers, each picturing an object that is at a different distance from the camera. On the left, you can see how each object is positioned relative to the camera, as if you were looking at them from the side. On the right, you can see how layers are positioned relative to each other as if you were looking at the scene from a corner. Below, you can see the scene from the camera's point of view.

NOTE: When creating a multiplane background, it is important to draw each layer fully. Even if some parts of a background layer is hidden behind a foreground layer in the camera's initial position, panning or zooming the camera may expose parts of background layers that are not initially visible.

In order to move a layer further from or closer to the Camera, you must change its position on the Z-axis. You can do this by moving a layer using the Transform Tool  in the Side or Top views. You can also move a layer on Z-axis directly from the Camera View by holding Alt and dragging the layer up or down. Positioning your element closer to the camera makes them appear bigger, and moving them further makes them appear smaller. It is also possible to move elements on the Z-axis without affecting their apparent size by using the Maintain Size  tool in the Advanced Animation toolbar.

It is a good idea to keep a Camera view open to see what your scene looks like while positioning elements in the Top and Side views.

NOTE: Just like with other transformations, transformations on the Z-axis on a parent layer will also affect the apparent position on the Z-axis of its child layers. Therefore, a child layer's apparent position on the Z-axis can be affected by any of its parents.

Setting Up Multiplanes

T-HFND-008-017

You can setup your elements as a multiplane to create a parallax effect when moving your camera. You simply need to spread and scale the objects on the Z-axis.

How to rotate a scene in the Perspective view

1. In the Tools toolbar, select the Rotate View  tool.
2. Click in the view, and drag the cursor around to rotate the view or press and hold Ctrl + Alt (Windows/Linux) or ⌘ + Alt (Mac OS X) and click and drag to rotate the view one axis at a time.

How to set up a multiplane

NOTE: Before distributing layers along the Z-axis using the Top and Side views, deselect the No Z Dragging option by selecting **Animation > No Z Dragging**. This option is disabled by default.

1. To maintain the visual scale in the Camera view as you move your element, do one of the following:
 - In the Advanced Animation toolbar, select the Maintain Size  tool.
 - From the top menu, select **Animation > Tools > Maintain Size**.
 - Press Alt + 6.
2. In the Side or Top view, select one of the layers in the thumbnails section. You can also select a layer from the Timeline view.

The selected layer is highlighted in the Top, Side and Camera views.

3. Drag the layer to the correct depth position in the camera cone. Your element aspect will remain the same in the Camera view.

4. For your element to scale up or down in relation to their distance to the camera, do one of the following:

- In the Tools toolbar, select the Transform  tool. Make sure the Peg Selection Mode  option is disabled in the Tool Properties view.
- In the Advanced Animation toolbar, select the Translate  tool and select a layer from the thumbnails section of the Top or Side view.
- Select a layer from the Timeline view.

The selected layer is highlighted in the camera cone.

5. In the Top view, drag the element sideways to position it horizontally. Hold Shift while dragging the element to make sure it only moves along the X-axis.
6. In the Side view, drag the selected element up or down to position it vertically. Hold Shift while dragging the element to make sure it only moves along the Y-axis.

About Clone and Duplicate Layers

At times, you will need to create a large group of characters such as a crowd, school of fish or flock of birds. You can do this by cloning or duplicating a layer. The difference between cloning and duplicating is that a clone uses the same drawings for all layers. A duplicated layer is simply an independent copy.

If you want to maintain the ability to modify drawings and propagate the changes through all layers, you should clone your layer. If you simply want to copy your layers and be able to modify your drawings without affecting the original layer, use the duplicate option.

About Clone Layers

A cloned layer is linked to the original element directory. If a drawing is modified in the original or cloned layer, both will be updated. However, cloned layers can have different timings.

Cloned layer - Changes to the original layer propagate to the cloned layer.

When cloning layers, you have the ability to clone the drawings and the corresponding columns (timing) or only the drawings. If you choose to clone the drawings and timing, your node will be linked to the same element folder, as well as the same drawing and function columns. Therefore, if you change the drawing exposure or keyframe on one layer, all cloned layers will be updated.

You may want to create a large group of characters reusing the same animation, but want to slightly offset the timing so they're not dancing or walking quite on the same beat. For example, if you create a walk-cycle for a soldier and want to use it for an entire army, you may want to have 50 layers with 50 different drawing exposures to produce a slight difference in the timing. If you copy your layers and drawings 50 times over, it will create a heavier scene. It is better to clone the 50 layers with only their drawings without linking to the same timing (function and exposure columns).

Cloning Layers

You can clone layers in several ways. Cloned layers use the same drawings.

How to clone a layer

1. In the Timeline, Xsheet view, select a layer to clone. You can select multiple layers.
2. Do one of the following:
 - From the Xsheet menu, select **Columns > Clone Selected Columns: Drawings Only** or **Columns > Clone Selected Columns: Drawings and Timing**.
 - From the top menu, select **Edit > Clone Drawings Only** or **Edit > Clone Drawings and Timing**.
 - From the Timeline menu, select **Layers > Clone Selected Layers: Drawings Only** or **Layers > Clone Selected Layers: Drawings and Timing**.
 - In the Timeline view, right-click on the layers and select **Clone Selected Layers: Drawings Only** or **Clone Selected Layers: Drawings and Timing**.

The cloned layer appears.

About Duplicate Layers

T-HFND-006-013

You can duplicate a layer to have a copy of the drawings that are independent from the original ones, as well as an independent timing (exposure). When you need the drawings to be modified independently, you will want to duplicate the layer instead of cloning it.

Duplicated layer - Changes to the original layer do not propagate to the duplicated layer.

Duplicating Layers

T-HFND-006-014

You can easily duplicate layers. Once duplicated, the layers are completely independent. Drawings are also duplicated.

How to duplicate a layer

1. In the Timeline, Xsheet view, select one or more layers.
2. Do one of the following:
 - In the Timeline menu, select **Layers > Duplicate Selected Layers**.
 - In the Timeline view, right-click on the layers and select **Duplicate Selected Layers**.
 - From the Xsheet menu, select **Columns > Duplicate Selected Layers**.
 - From the top menu, select **Edit > Duplicate**.

The duplicated layer appears.

About Timeline View Modes

The View Modes button lets you streamline the process of working with elements in the Timeline view. There are three different view modes you can choose to work in. With each mode you select, certain elements may or may not be visible in the Timeline view. Depending on your workflow, this can be useful for quickly hiding elements when you want to focus on specific ones. To select a view mode, use the drop-down menu in the bottom-left corner of the Timeline view.

Normal View Mode

Normal View  mode is the default Timeline view mode. It shows everything connected to the chosen display. In this mode, anything not connected to the currently set default display will not be shown in the Timeline view. This also means that you cannot add certain elements to the Timeline view, as by default, when added they are not connected to any display or composite node. An example of such an element is a peg.

NOTE: If you prefer to work as you did before, where you see everything in the Timeline whether it is connected to a Display or not, you can change the Always Display Unconnected Nodes setting in the Preferences dialog box, Timeline tab.

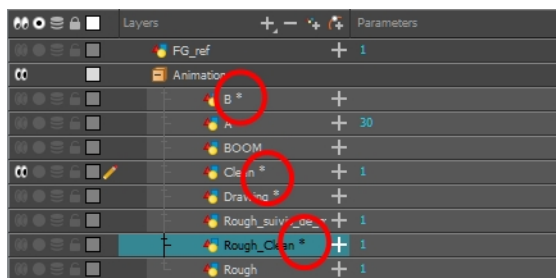

Selection Only Mode

When working in Selection Only  mode, only elements currently selected in the Camera or Node view will be visible in the Timeline. This makes it easier to concentrate on one or a few elements at a time.

View Tagged Layers

The View Tagged Nodes  mode lets

you see only elements which have been assigned a Tagged status. An item that has been tagged will appear in the Timeline view with a small asterisk beside its name.

Once your elements are tagged and you have switched over to View Tagged Layers mode, the Timeline view will display only tagged elements. The red bar on the left of the layers indicates you are in this view mode.

Viewing tagged layers in the Timeline view

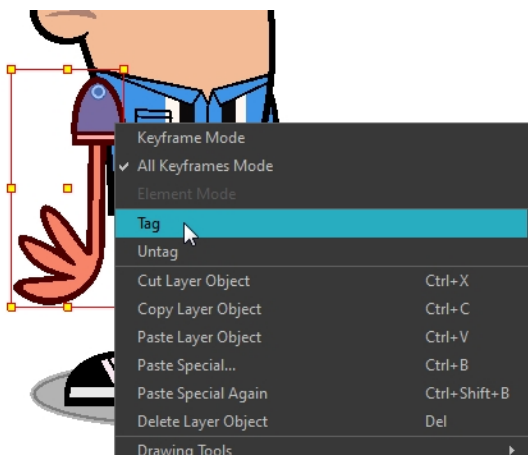

While in this mode, the asterisks are not displayed beside the tagged elements.

Tagging Layers

You can tag layers to easily visualize them in the Timeline view.

How to tag or untag elements in the Camera view

1. In the Camera view, select one or more elements.
2. Right-click and select **Tag** or **Untag**.

How to tag or untag elements in the Timeline or Node view

1. In the Timeline or Node view, select one or more elements.
2. Do one of the following:
 - Right-click and select **Tag** and one of the following:
 - In the Timeline or Node view menu, select **Edit > Tag** and one of the following:
 - **Timeline Tag**: Tags selected elements in the Timeline or Node views.
 - **Timeline Untag**: Untags selected layer in the Timeline view.
 - **Timeline Untag All**: Untags all tagged elements.
 - **Timeline Untag All Others**: Untags all elements except the selected one.

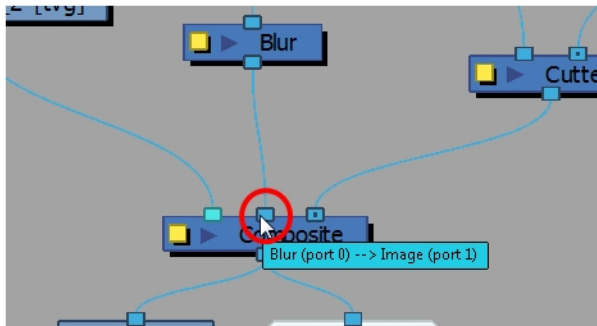

Displaying Port Tooltips

You can display any port tooltips by clicking on a port or connecting a cable.

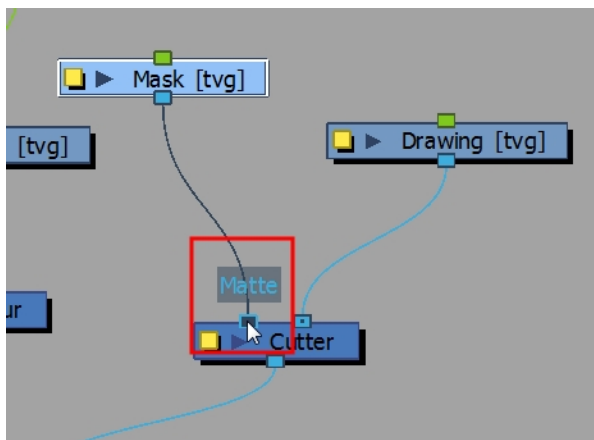

How to display a port's tooltip

1. In the Node view, hover the pointer over a port.

The port's tooltip displays source and destination information.

2. Click on any port to display the port type label. The label will also display as you connect cables into ports.

About Peg Nodes

The Peg nodes control the transformation of elements (position, scale, skewing and rotation) over time. The green ports at the top and bottom of the node indicate that it accepts transformation information which can be passed on (inputs and outputs transformation information).

One peg can be used to control many different nodes or one node can accept more than one peg. In a situation like the latter, one peg might be used to modify the rotation, while the other is used to modify the position of the effect and then animated differently over time.

One peg controlling many nodes

Multiple pegs controlling one node

Connecting and Disconnecting Nodes

You can connect nodes by dragging cables from output ports to input ports. You can disconnect nodes by pulling on the cable connections.

How to connect nodes

- In the Node view, do one of the following:
 - Extend a cable from the first node's output port (bottom port) and connect it to the second node's input port (top port).
 - Select the node to connect, hold down the Alt key and drag the node on an existing cable.

It is possible to create links between nodes in the Node view by clicking on one node and Ctrl-clicking (Windows) or ⌘-clicking (Mac OS X) on a second port.

Select a node and Ctrl-click (Windows) or ⌘-click (Mac OS X) a port:

- Click a node and then Ctrl-click (Windows) or ⌘-click (Mac OS X) the input port of a different node. The nodes are linked.
- Click the output port of a node, and then Ctrl-click (Windows) or ⌘-click (Mac OS X) a different node. The nodes are linked.
- Click the output port of a node, and then Ctrl-click (Windows) or ⌘-click (Mac OS X) a Composite node. The node is linked to a new input port of the Composite.
- Click a port of a node and then Ctrl+ Alt-click (Windows) or ⌘+ Alt-click (Mac OS X) port of a Composite node. The selected port replaces the link in the Composite's input port.
- Click an output port of a node and then Ctrl-click (Windows) or ⌘-click (Mac OS X) the input port of a Group node. The selected output port replaces the link to the group.
- Click an output port of a node and then Ctrl+ Alt-click (Windows) or ⌘+ Alt-click (Mac OS X) the input port of a Group node. The selected output port links to a new in-port of the group.

NOTE: You can reconnect a node's output port without disconnecting its destination port by dragging the connect from the output port to another output port while holding Ctrl (Windows/Linux) or ⌘ (Mac OS X).

How to disconnect nodes

1. In the Node view, select the node to disconnect, hold down the Alt key and drag the node away. You can also pull on the connection cable.

Grouping Layers

You can group your elements to keep your work organized.

How to group elements in the Timeline view

1. In the Timeline view, select the elements you want to group.

Any layers between the selected layers will be automatically grouped as well, so if the stacking order does not matter, move extra layers above or below the layers want to group.

2. Do one of the followings:

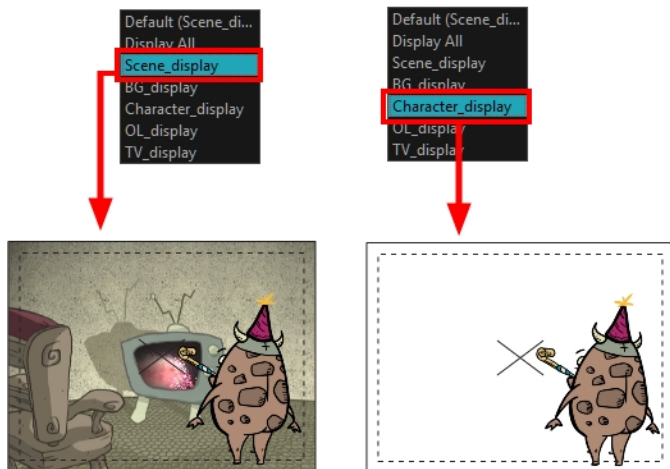

- Right-click on the highlighted layers and select **Group Selection**.

The layers appear indented under a new Group layer in the Timeline view.

About Displays

When you open a scene coming from Harmony Premium, it may contain multiple Display nodes allowing you to see isolated portions of the scene.

The Display node is an important node; it is used by the export and views to display your scene, primarily the Camera and Timeline views. By default, a scene's node system always has a Display node which can be used to show your entire scene, a single node or a group of nodes through a Composite or Group node. You might use it to see one single character as you animate it, debug your node system as you create complex effects or export your complete scene or a portion of it.

Harmony Advanced doesn't allow you to add Display nodes. The display selection feature is only available for the possible scenario that you need to use a specific Display node created by a Harmony Premium user.

When your scene does not have a Display node, it is automatically set to Display All which uses the Timeline view ordering and shows floating nodes from the Node view. You can also set your scene to use Display All using the Display toolbar.

NOTE: If you try to add a peg or other transformation layer in the Timeline view without having a layer selected, an error message will display. Make sure to change to Display All. The peg layer will be floating in the Node view and will not be visible in the Timeline view. The Timeline view shows only layers that are connected to the Composite node.

If you switch to Display All, you run the risk of not realizing when you have floating nodes that are not connected to your composite. For this reason, it is not recommended to work in Display All mode.

Changing Global Displays

If you are working on a scene in which several displays were added, you can change which display to view the scene from.

NOTE: Displays can only be added in Harmony Premium.

How to set a different Display node as a global display

1. From the top menu, select **Scene > Default Display** and select a display.
Each view is updated if set to the Default display option.

Setting Properties for Many Layers

When working with several layers, you may frequently want to modify a series of settings. Instead of opening the properties for each individual layer, you can set the properties for many layers so you can change a common setting in a single click.

This allows you to modify the following settings:

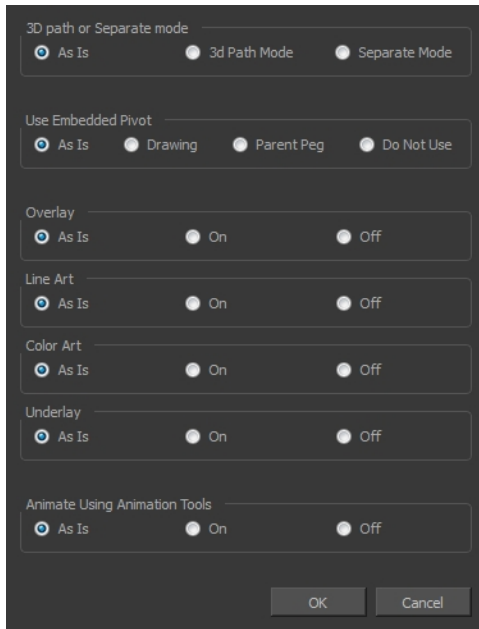

- 3D Path or Separate mode
- Use Embedded Pivot
- Overlay
- Line Art
- Colour Art
- Underlay
- Animate Using Animation Tools

NOTE: You can add the button to the Timeline View toolbar through the Toolbar Manager. In the Toolbar Manager, you will find the feature in the script section under the name Script: TB_Set_Properties_on_manu_layers in TB_Set_Properties_on_many_layers.js.

How to set properties for many layers

1. In the Timeline view, select all the layers you want to modify at the same time.
2. In the Timeline View toolbar, click the Set Properties for Many Layers  button. This option is not available by default in the Timeline View toolbar. You must add it through the Customize option. Right-click on the toolbar and select Customize. In the Available Tools list, select Script: TB_Set_Properties_on_many_layers and move it to the Toolbar list.

The Set Properties for Many Layers dialog box opens.

3. Modify the properties. If your nodes have different parameters enabled for a certain setting, leave the **As Is** option selected to avoid modifying it. Each node will keep its original setting. Select any other options for all nodes to change to this parameter regardless of their original setting.
4. Click **OK**.

Chapter 16: Motion Paths

With Harmony, you can animate layers using computer-generated trajectories, create multiplane camera moves and camera shakes, adjust the easing, shape your paths with control points and much more.

Before animating the position of your layers, you need to create motion paths which are trajectories on which you can attach drawing objects. Using keyframes, you can then record key positions along the trajectory.

Harmony's wide range of features let you produce simple and advanced motions and trajectories. By creating a simple motion, you will learn the basics of animating a layer.

There are two ways to create motion paths: animated drawing layers and pegs. They each have different purposes.

About Pegs

T-HFND-009-004

A Peg layer is a trajectory that contains no drawings on which you can hook your drawings.

Pegs have been used for a long time in the traditional animation process, mainly for registration purposes. Peg holes at the bottom or top of the animation paper are used to keep all the sheets even and at the same registration.

There are three peg holes in regular animation paper. The centre peg hole is round while the left and right ones are oval shaped. The oval peg holes are located on each side of the page, four inches away from the centre peg hole.

To keep the drawings together, the animator uses a peg bar. This peg bar has three pins that correspond to the shape and location of the peg holes. Peg bars are normally found at the bottom and top of animation discs.

Before digital compositing, the peg bars were also used to move layers on the camera stand to create pans and camera moves. They were the equivalent of digital trajectories. Harmony makes use of these concepts to create animation and camera motion.

A peg is composed of many customizable parameters. These parameters are:

- X, Y and Z positions (3D Path or Separate Positions)
- Angle (rotation)
- Skew
- X and Y Scales

You can control a peg's trajectory the same way as the animated drawing layer.

A peg layer is mainly used to control a series of drawing layers, such as clouds, a school of fish or a flock of birds. You can attach them to a peg layer and make them follow a trajectory as a single unit. This makes trajectory

modifications much easier and faster. When building a puppet, most of the time you will add a master peg to control your puppet as one object.

Adding Pegs

T-ANIMCO-001-001

You can add peg to your Timeline view and parent the layers to animate to it.

How to add a peg in the Timeline view

1. In the Timeline view, select the layer on which you want to attach a peg.

2. Do one of the following:

- From the Timeline View layers toolbar, click the Add Peg  button.
- From the Timeline view menu, select **Insert > Peg**.
- From the top menu, select **Insert > Peg**.
- Press Ctrl + P (Windows/Linux) or ⌘ + P (Mac OS X).

The layer that was originally selected becomes a child of the new parent Peg layer. The new Peg layer automatically takes the name of its child layer, with the addition of the suffix -P.

The indentation of the layer, along with the "L" indicates hierarchy and that the layer is attached to the Peg layer. This relationship is called a parent-child relationship.

3. If you intend to add multiple pegs or if the layer name that was added to the peg does not accurately represent the content of the Peg layer, you can rename it. Click the layer name and type in a new name. Or double-click the layer and type a new name into the dialog box.

4. If you did not create your peg layer directly above the layer you intended on parenting it to, then drag the layer you want to attach to the peg and drop it directly below the Peg layer. The indentation of the layer below the Peg layer indicates whether it was correctly attached or not.

- You can unparent layers by holding down Shift and dragging the selected parents away from

the child layer. Drop your selected between other layers.

Enabling Peg Selection Mode

In the Tool Properties view, the Peg Selection Mode  lets you automatically select the peg layers in the Camera view instead of the drawing layers. If you animate with pegs instead of animating the drawing layers directly, enable the Peg Selection Mode to avoid having to select in the Timeline view or use the Select Parent Skipping Effects command.

How to enable the Peg Selection Mode

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
1. In the Tool Properties view, click the Peg Selection Mode  button.
2. In the Camera view, select an element parented to a peg.

About Drawing Layers

T-ANIMCO-001-002

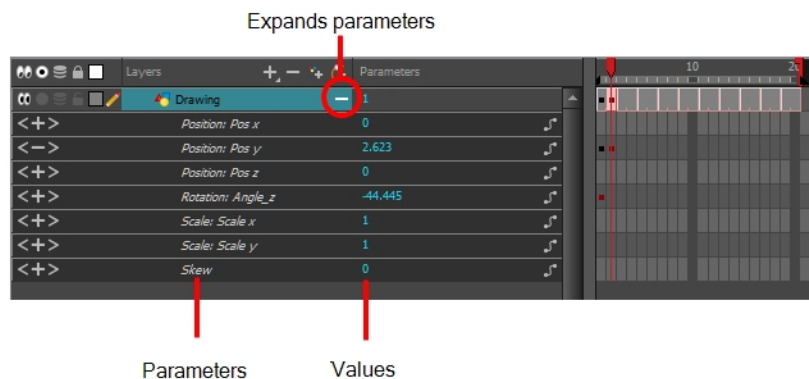

You can create a motion path directly on layers (animated layers).

You can control and define a trajectory using several different parameters, including:

- X, Y and Z positions (3D Path or Separate Positions)
- Angle (rotation)
- Skew
- X and Y Scales

Harmony keeps track of each parameter of each layer by storing them in their own function curve. When you add a keyframe to a layer, a keyframe is created on each of these functions, and transformations done on a layer via the Camera view are translated into coordinates which are then stored in those functions. It is possible to edit these functions individually using the Function view, but that is rarely necessary, as Harmony provides easy-to-use tools for visually controlling trajectories and timing in the Camera and Timeline views.

If you do not want to animate a drawing layer, you can turn off its animation parameter. To do so, simply select the layer and in the Layer Properties view, deselect the Animate Using Animation Tools option on the Controls tab. If your layer was already animated, then your keyframes will appear dimmed so you can easily identify them as ones that cannot be modified. To modify keyframes, select the Animate Using Animation Tools options.

Disabling Layer Animation

By default, you can animate a drawing layer using the same parameters as a peg, but you can choose not to do so by turning off this feature. This allows you to switch your drawing layers so they can no longer be animated without a peg, which has certain advantages. In cut-out animation, it's easier to separate drawing exposure and keyframes to change the timing and rearrange keyframe position in the Timeline view. This also works for backward compatibility when bringing in templates created in older versions of Harmony so as not to lose their offset keyframes or drawing substitution keyframes.

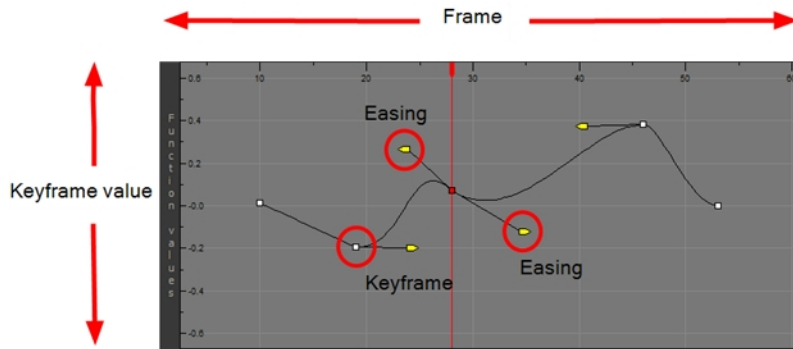

How to disable the animation feature on a layer

1. In the Timeline view, double-click the layer on which you want to set the parameter.
The Layer Properties editor opens.
2. In the Controls tab, deselect the **Animate Using Animation Tools** option.

About Layer Parameters

T-HFND-009-008

A layer is composed of many customizable parameters, such as the X, Y and Z positions, angle (rotation), skew and scales. Each parameter has its own function which is a mathematical formula expressing the relationship between position values. You can view each function on a graph as a simple curve, such as the one below.

There are several options available for setting up function parameters:

- Locked Positions (3D Path)
- Separate Positions
- Locked Scales
- Separate Scales

Locked Positions

Separate Positions

Locked Scale

Separate Scale

You must select 3D Path, Separate Positions, Separate Scale, or Locked Scale before starting the animation. When you lock or unlock parameters, this does not convert the functions from one to the other, but creates new ones.

In a 3D Path, the X, Y and Z curves are locked together and controlled by a single velocity function. When you add a keyframe, it is added on all three trajectories at once, as is the velocity. This is very useful for long, smooth trajectories.

When using a 3D path, the X, Y and Z functions work together using the same keyframes. This allows for the velocity to control the curve and create a smooth trajectory. Even if a function does not have any variation on its curve (for example, all keyframes are at zero), the velocity might add a slight motion to ensure a smooth trajectory. This can cause elements that are very close to each other on the Z-axis to pop in front of one another. This is why in cut-out animation it is recommended to use separate position settings. But if you work with 3D path, you can use the Constant Z feature to avoid this from happening.

The Constant Z feature is used when creating motion keyframes. The Z function will use stop-motion keyframes and will not be interpolated, which can be very useful for cut-out animation. The Constant Z feature only works with 3D paths.

When the Separate Positions option is used, the X, Y and Z curves are independent and have velocity controls directly on their function curve. This is useful when you want to set keyframes on one of the curves without affecting the others.

When using the Scale parameter, you can use a single function curve to control both the vertical and horizontal scale, or two separate scales. When using a single function curve, the values are the same for the X (horizontal) and Y (vertical) axes for uniform size changes without distortion. However, if you separate the scale functions, you can squash, stretch and skew your elements.

Displaying Layer Parameters

T-ANIMCO-001-004

You can easily display the parameters for each layer in the Timeline view.

How to display the layer parameters in the Timeline view

1. Do one of the following:
 - In the Timeline's left side, click a layer's Expand **+** button.
 - In the Timeline view menu, select **View > Show Functions**.
 - Press **Alt + F**.

Layer parameters are displayed

Setting Layer Parameters

T-ANIMCO-001-003

You can modify the layer parameters to different types of function and linking some of them together.

How to set the layer parameters

1. In the Timeline view, double-click on the layer on which you want to set the parameter. You can also see the parameters in the Layer Properties window when you select the layer in the Timeline view.

The Layer Properties window opens.

2. Select the **Transformation** tab.
3. In the Position section, select the **3D Path** or **Separate** option.
4. In the Scale section, select the **Locked** or **Separate** option.
5. Click **Close**.

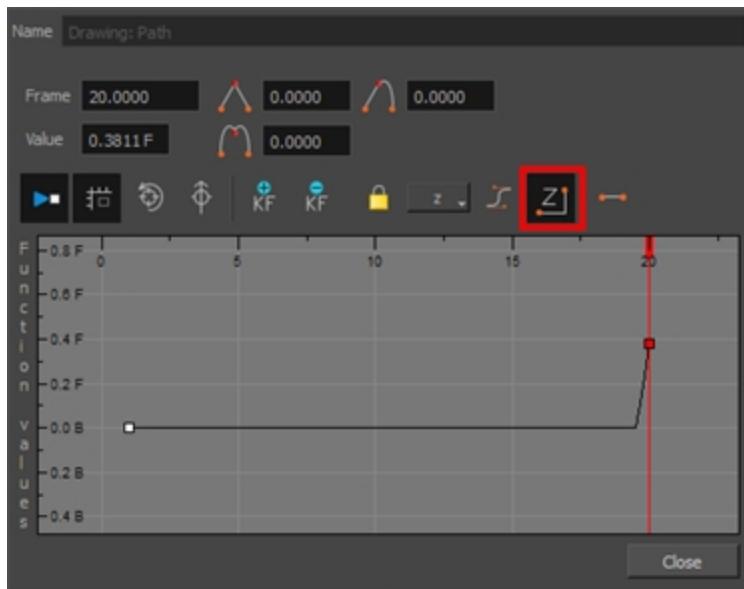

Enabling Constant Z

T-HFND-009-008A

You can also enable the Constant Z option directly in the Function view for specific functions.

How to enable the Constant Z option

1. In the Timeline view, expand the layer on which you want to set the Constant Z feature. Note that you must select the **3D Path** option for the layer.
2. Double-click on one of the position functions to open the Function editor.
3. In the Function editor, select the Constant Z  button.

About Keyframes

T-HFND-009-005

Interpolation is the computer-generated motion between two keyframes. Some animators and composers like to create their own in-betweens, while others like to have the computer do it. Harmony has stop-motion (no interpolation) and motion keyframes (computer-generated interpolation).

In stop-motion keyframes, there is no computer-generated motion between two keyframes. The segment is constant or flat. The drawing remains still until the playback reaches the next keyframe, then the drawing pops to its new location.

In motion keyframes, there is no automatic interpolation created between the selected point and the next one. The layer will maintain its position until the animation reaches the frame of the next point and will then jump to the new position. Deselect this option to generate interpolation and get the layer to progressively move to the next position.

Enabling the Animate Mode

T-ANIMCO-001-007

The Animate mode records the position, rotation, scale, skew, etc. of objects as keyframes in the Timeline view. Turn off the Animate mode to reposition objects for the entire scene. When the Animate mode is disabled, keyframes are not created when an object's parameters change.

When positioning elements, make sure the Animate Mode is turned off, or it will create a keyframe on your drawing layer. The animate mode is used to animate layers over time.

Animate mode is on.
(Pushed in)

Animate mode is off.

How to turn the Animate mode on or off

1. In the Tools toolbar, click the Animate  button or select **Animation > Animate**.

About Keyframe Creation

There are several different ways you can create keyframes. You can add a coordinate keyframe, position keyframe or a keyframe along with your drawing duplication.

You can create a keyframe without a drawing. This adds new coordinate points but the drawing in the layer stays the same. At the same time, you may also want to duplicate your drawing if you need to modify it and do not want to modify the original.

You can also add a position keyframe instead of a regular keyframe. When you do this, keyframes will only be added on the X, Y and Z parameters of the selected layer. Keyframes are not added on the Angle, Scale and Skew parameters.

Creating Keyframes in the Timeline View

T-HFND-009-006

You can add keyframes in the Timeline view to multiple layers, a single layer or a specific parameter.

How to create keyframes in the Timeline view

1. In the Timeline view, select the cell on which you want to add a keyframe.

2. Add a keyframe by doing one of the following:
 - From the top menu, select **Insert > Keyframe**.
 - Right-click on the selection and select **Insert Keyframe**.
 - Press F6.
 - In the Timeline View toolbar, click the Add Keyframe  button.

If the Animate mode is enabled in the Camera view, a keyframe is automatically created on the current frame.

How to add a keyframe for a specific parameter

1. On the right side of the Timeline view, select a cell on the layer's function that you want to animate.

2. Do one of the following:
 - Right-click the selected cell and select **Insert Keyframe**.
 - Press F6.
 - In the Timeline View menu, select **Motion > Insert Keyframe**.
 - In the Timeline View toolbar, click the Add Keyframe  button.

How to create a keyframe and duplicate the drawing at the same time

1. In the Timeline view, select the cell containing the drawing you want to duplicate and add a keyframe.

2. Do one of the following:
 - From the top menu, select **Insert > Keyframe and Duplicate Drawing**.
 - Right-click on the selection and select **Insert Keyframe and Duplicate Drawing**.
 - Press F6.

A keyframe and a duplicate of the drawing is created. The duplicated drawing sits on top of the original drawing.

How to add a Position keyframe

1. In the Timeline view, select the cell on which you want to add a position keyframe.

2. From the top menu, select **Insert > Position Keyframe**.

Creating Keyframes in the Function View

You can add keyframe directly on the graph using the Function view.

How to add or delete keyframes in the Function editor

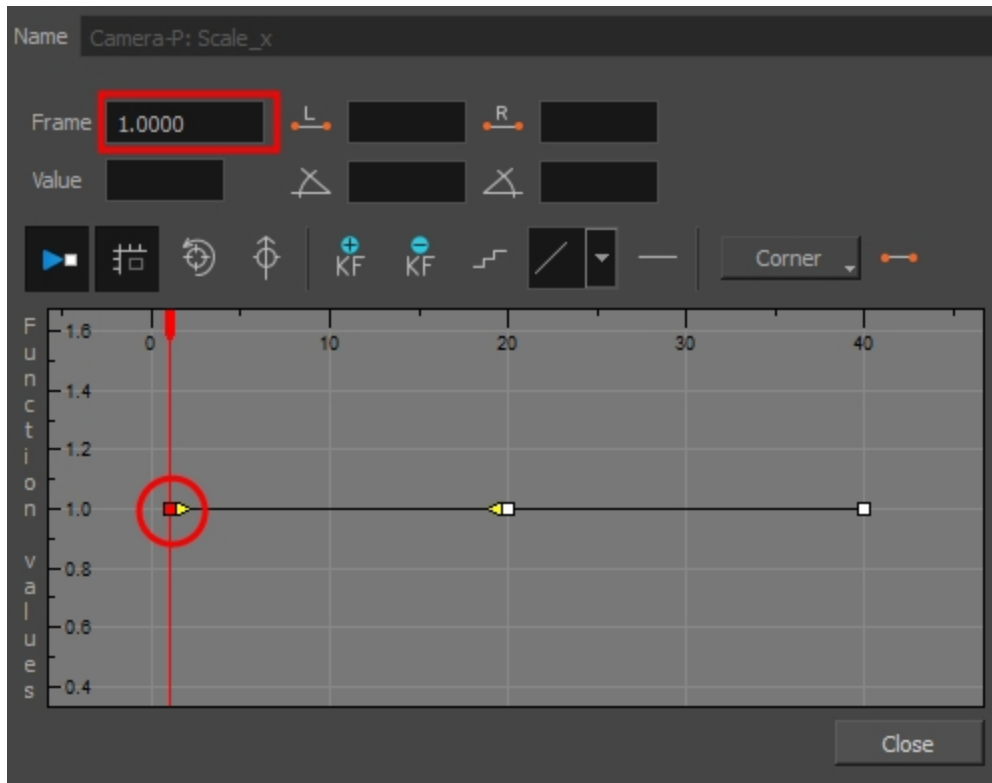

1. In the Timeline view, open the drawing or layer's parameters by clicking the Expand **+** button or press Alt + F.

1. Double-click on the parameter layer name to open the Function editor window or click once on the parameter layer to display it in the Function view's left sidebar. If you are using the Function view, you must click on the function name from the sidebar list to view it in the graph display region.
2. In the Function editor, do one of the following:
 - In the graph section, click on the frame where you want to make changes.
 - In the Frame field, enter the frame number.

In the graph display area, the red playhead moves to that frame number.

3. In the Function editor, click the Add Keyframe **KF** button.

4. Click on the newly created keyframe and drag it up to increase the value of the function or down to decrease the value. Depending on the selected function, this could increase or decrease the width of the object (scale_x) or change the object's vertical position (position_y). Pull on the handles to create non-linear transition speeds between keyframes.
5. If you do not like the changes you just made, select and delete the new keyframe by pressing Delete or clicking the and Delete keyframe  button.

You can delete an existing keyframe by using the same process.

Creating Keyframes in the Xsheet View

If you prefer working with the Xsheet view, you can also create keyframes and type values in the Xsheet view.

To edit a function column in the Xsheet view, you must first display the Functions section of the Xsheet view and then select the layer you want to modify. If you double-click on a function column's header, you will display the corresponding function curve in the Function editor.

How to add a keyframe in the Xsheet view

1. In the Xsheet view, click the Expand button located on the right side of the main section to show the Functions section.

1. In the Timeline view, select the layer that contains the parameters to modify.

The columns appear in the Xsheet view if function curves were previously created by adding keyframes in the Xsheet view or Layer Properties window. Otherwise, the columns do not appear.

Drawing		Drawing Pos_x	Drawing Pos_y	Drawing Pos_z	Drawing Scale_x	Drawing Scale_y	Drawing Angle
1	1	0.000	0.000	0.000	1.000	1.000	
2							
3							
4							
5							
6							
7							
8							
9							
10							
11							
12							
13							
14							
15							
16							

2. In the Xsheet view, go to the function column on which you want to add a keyframe.
3. Double-click on the cell on which you want to add a keyframe and type a numeric value.

Drawing Pos_x	Drawing Pos_y	Drawing Pos_z
1	0.000	0.000
2		
3	0.000	
4		
5		
6		
7		
8		
9		

4. Press Enter/Return to continue to the next cell.
5. Press Esc to exit the typing mode.

	Drawing Pos_x	Drawing Pos_y	Drawing Pos_z
1	0.000	0.000	0.000
2	2.500		
3	5.000		
4	5.000		
5			
6			
7			
8			
9			

How to convert a cell into a keyframe

1. In the Xsheet view, go to the function column on which you want to add a keyframe.
2. Select the cell to convert.

	Drawing Path x	Drawing Path y
1	0.000	0.000
2	1.000 E	
3	2.000 E	
4	3.000 E	
5	4.000 E	
6	5.000 E	0.000
7	6.000 E	
8	7.000 E	
9	8.000 E	
10	9.000 E	0.000
11		

3. Right-click on the cell and select **Set Selection As Keyframe** or press F6.

	Drawing Path x	Drawing Path y
1	0.000	0.000
2	1.000 E	
3	2.000 E	
4	3.000 E	
5	4.000 E	
6	5.000 E	0.000
7	6.000 E	
8	7.000 E	
9	8.000 E	
10	9.000 E	0.000
11		

4. To remove a keyframe, select the keyframe, right-click on the cell and select **Clear Keyframe in Selection** or press F7.

Deleting Keyframes

T-HFND-009-007

You can delete keyframes independently from drawing exposure.

NOTE: If you select a keyframe in the Timeline view and press the Delete key, you will also delete the drawing exposure. To only delete the keyframe, you must use the Delete Keyframe command.

How to delete a keyframe

1. In the Timeline view, select a keyframe and do one of the following:
 - Right-click and select **Delete Keyframes**.
 - In the Timeline view menu, select **Motion > Delete Keyframes**.
 - From the top menu, select **Animation > Delete Keyframe**.
 - Press F7.
 - In the Timeline View toolbar, click on the Delete Keyframes  button.
 - Use the Transform  tool to select a keyframe to delete from the trajectory in the Camera view and press Delete.

Animating with Keyframes

T-ANIMCO-001-005

You can animate a layer or a peg by creating keyframes and moving your drawings in the Camera view.

How to animate a layer or a peg

1. In the Tools toolbar, select the Transform  tool or press Shift + T.
2. If you have parent pegs and are animating a drawing layer, in the Tool Properties view, make sure the Peg Selection Mode  is deselected.
3. In the Tools toolbar, enable the Animate  mode. This allows the Transform tool to affect the position and size of a layer at the current keyframe only, whereas it would otherwise affect the layer's position and size throughout the whole scene.
4. In the Timeline view, go to the first frame.

5. Select the cell where you want to create your first keyframe. Right-click on the selection and select **Insert Keyframe**.

A keyframe is created on the first frame of the Timeline view.

6. In the Camera view, select the element to animate and move it to its first position.

7. In the Timeline view, go to the frame on which you want to set the second position.

8. Select the cell where you want to create your first keyframe. Right-click on the selection and select **Insert Keyframe**.

A second keyframe is created on the Timeline view.

9. In the Camera view, move the element to its second position.

10. In the Timeline view, select the first frame to rewind to the beginning of your animation.
11. In the Playback toolbar, click on the Play ► button to preview your animation.

NOTE: If you animate layers on the Z axis, you may want to preview your animations from the Top, Side or Perspective views while during playback. By default, playback is disabled in those view. To enable them, from the top menu, select **Play > Enable Playback > Top View, Side View or Perspective View**.

Changing Keyframe Values

Once a keyframe is added, beside moving the image in the Camera view, you can change its value by typing it in the Timeline and Function views.

How to change the keyframe values in the Timeline view

1. In the Timeline view, open the drawing or layer's parameters by clicking the Expand **+** button or press Alt + F.

2. Select the parameter for which you want to create a function curve.
3. Place the cursor over the blue number value of the parameter and do one of the following:
 - Wait until the cursor changes to a white hand with a two-way arrow and then drag the hand left to decrease the value or right to increase the value.

- Double-click on the blue number and enter a value in the field.

How to change a keyframe value in the Function editor

1. In the Timeline view, open the peg element's parameters by clicking the Plus **+** sign next the peg layer's name.

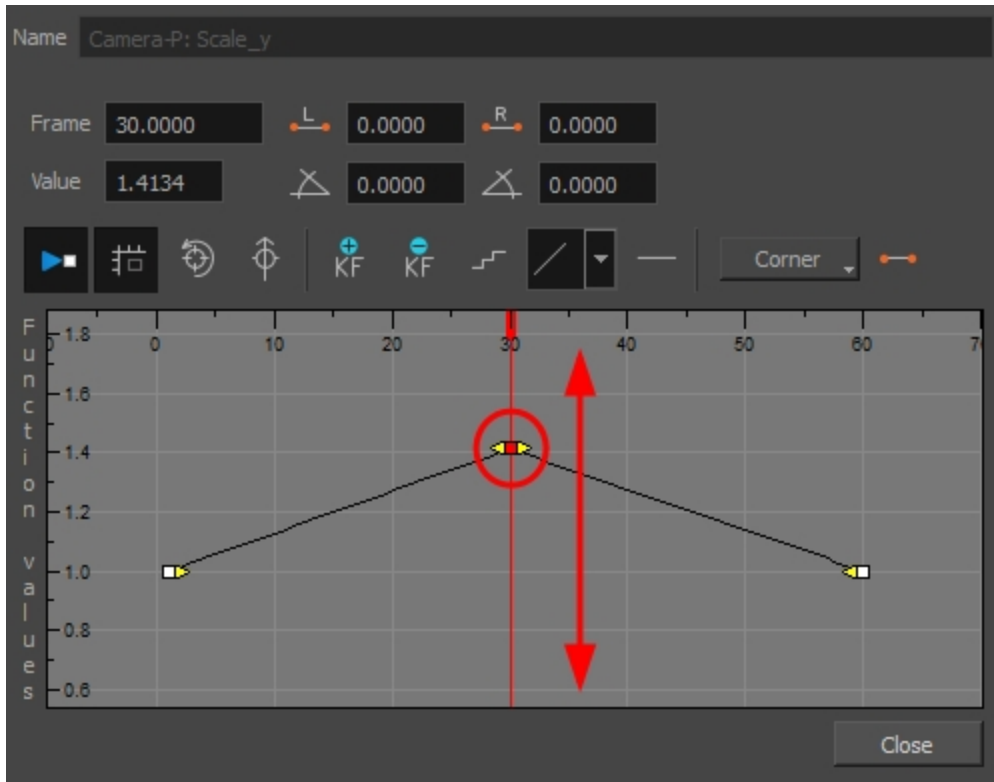

Collapsed Peg layer

Expanded Peg layer

2. Double-click on the parameter layer name to open the Editor window or click once on the parameter layer to display it in the Function view.

3. In the Value field, enter a value. You can also drag the keyframe up or down in the graph.
4. Press Enter/Return or click the Play  button to view the changes made in the Camera view.
5. Keep adjusting the values until you are satisfied with the results.
6. Click **Close**.

Switching Keyframe Types

T-ANIMCO-001-006

You can switch a keyframe from stop-motion to motion at any time in the Timeline view and Function Editor.

How to switch between motion and stop-motion in the Timeline view

1. On the right side of the Timeline view, select one or more keyframes to modify.

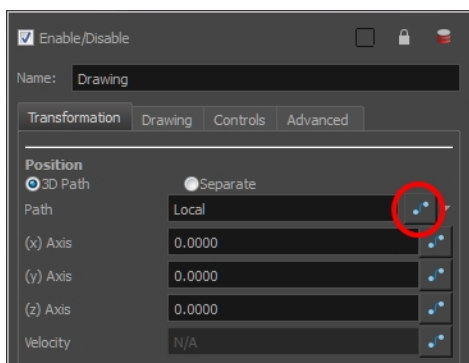

2. Switch between motion and stop-motion by doing one of the following:
 - Right-click on the selected keyframes and select **Set Motion Keyframes** or **Set Stop-Motion Keyframes**.
 - Press Ctrl + K (Windows/Linux) or ⌘ + K (Mac OS X) for motion keyframes and Ctrl + L (Windows/Linux) or ⌘ + L (Mac OS X) for stop-motion keyframes.
 - In the Timeline View toolbar, click the Motion Keyframe  or Stop-Motion Keyframe  button.

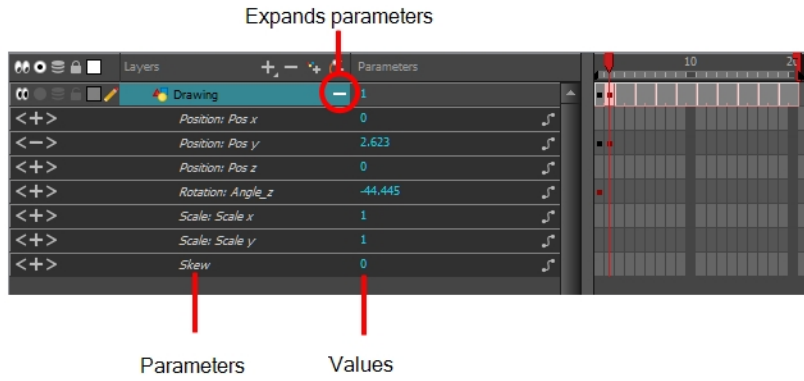

How to switch between motion and stop-motion keyframes in the Function view

1. Open the Function view.
2. In the Timeline view, double-click on the layer that contains the keyframes you want to convert.

The Layer Properties window opens.

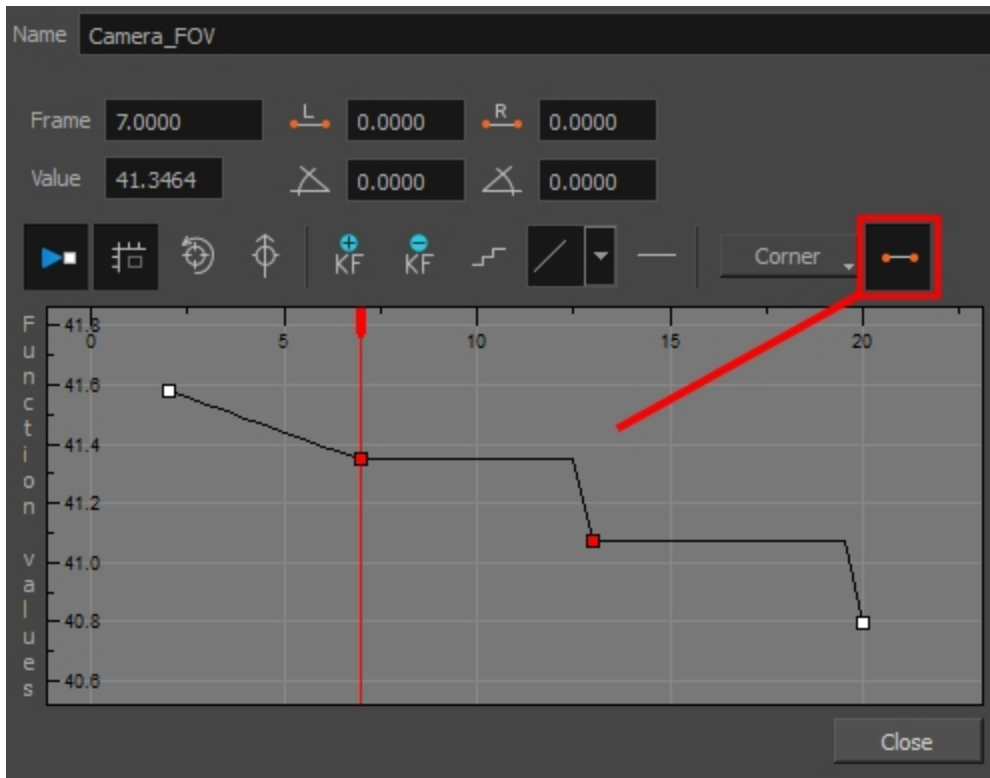

3. Do one of the following:
 - In the Transformation tab, click the Function Editor  button.
 - In the Timeline view, click the Expand Function  button or press Alt + F and double-click on the function to edit.

4. On the function curve, select one or more keyframes to modify.

5. Select or deselect the Stop-motion Keyframe button to set a stop-motion or motion keyframe.

Changing Stop-motion Keyframe Colour

To easily identify stop-motion keyframes in the Timeline view, you can customize the colour in the Preferences dialog box.

Stop-motion keyframe colour customized to orange

How to set the stop-motion keyframe colour

1. Open the Preferences dialog box by pressing **Ctrl + U** (Windows/Linux) or **⌘ + U** (Mac OS X).
2. Select the **General** tab.
3. In the Colours section, click **Edit Colours**.
4. In the Colours dialog box, select the **Xsheet and Timeline** tab.
5. In the Timeline section, click the **Stop Motion Keyframe** swatch.
6. In the Select Colour window, select a new colour and close the windows.

Jumping to Keyframes

You can jump between the selected layer's keyframes in the Timeline view.

How to jump to keyframes

1. In the Camera or Timeline view, select the layer that contains the keyframes you want to flip through.

2. From the top menu, select **Animation > Go to Previous Keyframe** or **Go to Next Keyframe** or press semi-colon (;) and single quote (').

About Controls

T-HFND-009-010

Camera moves and motion paths can become quite advanced, especially with moves through 3D space. Harmony provides tools to view your camera's path and make adjustments to it from both a 2D and 3D perspective.

You can display the trajectory of a motion path when you select an object from any view it can be selected in.

A motion path is easy to manipulate. One important concept to understand is that a trajectory contains both keyframes and control points. Both can be used to shape a path; each have their own behaviour, however only keyframes appear in the Timeline view.

- **Keyframes** have a transformation value and a position in space at a given frame. Keyframes are locked in time.
- **Control points** have a position but no fixed frame or timing. It is mainly used to deform a trajectory. There are no velocity handles available on a control point. The velocity segments are set between keyframes only, making curves and trajectories much smoother. Control points can only be added on a 3D path.

You can set the default Continuity, Bias and Tension parameters in the Preferences panel.

Continuity: Controls the smoothness of a transition between the segments joined by a point.

Tension: Controls how sharply the path bends as it passes through a control point or keyframe.

Bias: Controls the slope of the path so it flows towards one side of the motion point or the other.

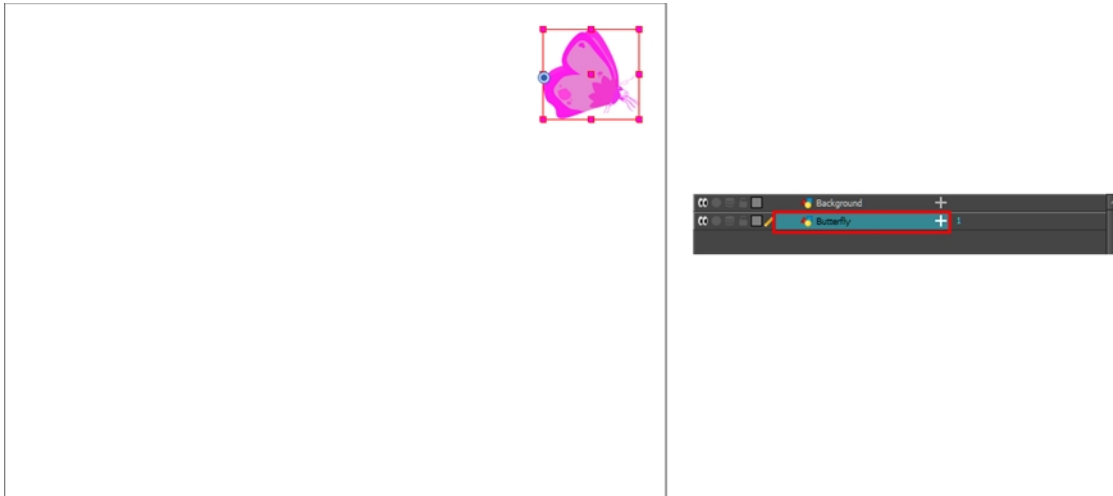

Displaying Controls

T-HFND-009-011

You can display a layer's controls to adjust a trajectory or other parameters such as a gradient's position or deformation settings.

How to display the layer's controls

1. Verify that the Camera view (click its tab) is selected and that the layer whose trajectory you want to display is selected in the Timeline view.

2. From the top menu, select **View > Show > Control** or press Shift + F11 or in the Camera view toolbar, click on the Show Control  button.

NOTE: If nothing appears in the Camera view, you may not have animated or selected the layer.

Adding Control Points

T-HFND-009-012

You can add control points on 3D Path trajectories. You need to display the layer's controls in the Camera view.

How to add a control point on a trajectory

1. In the Timeline or Camera view, select the peg or layer on which you want to add a control point.
2. If the selected element's trajectory is not displayed, select **View > Show > Control** from the top menu or press Shift + F11.

The trajectory appears in the Camera, Top, Side and Perspective views.

3. Add control points on a 3D path trajectory by placing the cursor where you want to add the point and press P once. If you hold the key down, control points will be added continuously until you release the key.

A control point is added to the trajectory.

Toggling Point Types

You can convert a control point into a keyframe and a keyframe into a control point. The position and other values will remain in both cases, only the frame will change. A control point is not locked in time.

How to switch between keyframe and control point

1. In the Camera view, use the Transform  tool select a point to convert.
2. To convert the point:
 - From the top menu, select **Animation > Lock in Time**.
 - In the Function view or Function Editor, select the keyframe to convert and click the Lock in Time  button.

- Press Alt+L.

Adjusting Tension, Bias, and Continuity

You can adjust the shape of the curve passing through a point by modifying the bias, tension, and continuity settings. You can also set preferred settings as default.

How to adjust the control point preferences

1. From the top menu, select **Edit > Preferences** (Windows) or **Harmony Advanced > Preferences** (Mac OS X).

The Preferences dialog box opens.

2. Select the **Camera** tab and adjust the parameters in the Control Points section.

Converting Angled and Curved Corners

When you select a control point on a path, you can switch between a rounded or angled corner by using the Linear/Curve command.

How convert an angled or curved corner

1. In the Timeline view, double-click the layer that contains the point you want to convert.
The Layer Properties window opens.
2. On the Transformation tab, select the **3D Path** option.
3. In the Tools toolbar, select the Transform  tool or press Shift + T.
4. In the Camera view, select the point to convert.
5. From the top menu, select **Animation > Linear Motion**.

Offsetting Trajectories

By offsetting a trajectory, you can reposition the visual trajectory without offsetting or modifying your animation. By default, the trajectory is located at 0,0,0 fields. If your elements were drawn in a different location than the centre of the drawing area, it will look like the trajectory is not aligned with your drawing. Also, if you have several elements attached to one trajectory, you might want your trajectory to be at a different location to represent the group's motion better.

How to offset a trajectory

1. In the Animation Tools toolbar, select the Spline Offset  tool or press Alt + 8.
2. In the Camera, Top, Side or Timeline view, select the layer whose trajectory you want to offset.
3. From the top menu, select **View > Show > Control** to display the trajectory. If you do not display the trajectory, any transformation done using the Spline Offset tool will be ignored.

4. In the Camera view, drag the trajectory to the proper position. You can move it on the X and Y axes, but also on the Z-axis using the Top and Side views.

Trajectory is moved downwards

About Functions

By default, when a drawing layer or peg is added to a scene, no function curves are created. You will generally create the ones you need to avoid being overloaded with too many functions you might not use.

When you select an element in the Camera view and move it around, it will automatically create the corresponding function curves. If you need to create certain functions manually, you can always do it through the Layer Properties view or editor. You can then share it with other layer parameters or set keyframes directly on the function curve instead of doing it in the Timeline or Camera view.

You can also link a layer's parameter to an existing function curve or attach several parameters to the same function curve. For example, if you have an aircraft performing loops between clouds, you may want the camera to follow the aircraft's motion path. If you attach the camera to the aircraft's layer, the camera will also loop, but this may produce undesirable results and even induce a feeling of motion sickness as you watch the final animation. Instead, you can share the X, Y and Z positions of the aircraft with the camera's peg layer, but ignore the angle, scale and skew.

By default, all function curves can only be used and modified using their original parameter. If you want another layer or parameter to use the same function curve, you must share it.

There are two ways to share a function:

- Share Functions command
- Layer Properties editor

When you create a function curve in the Layer Properties view or editor, there are several choices available:

Parameter	Description
Create 3D Path	Creates a new 3D Path Column set
Create Bezier	Creates a new Bezier curve
Local	Disconnects the parameter from any function and changes it to shared.
3D Path	Displays the list of every shared 3D Path function available
Bezier	Displays the list of every shared Bezier curve available
Velobased	Displays the list of every shared velocity based curve available
3D Rotation	Displays the list of every shared 3D Rotation function available
Connected	Displays the list of every shared connected function curve
Unconnected	Displays the list of every shared unconnected function curve
All	Displays the list of every shared function curve

You have the choice of creating a new function curve or linking it to a shared function. This way, you can have two or more parameters following the same function.

Depending on your favourite working method, you can create different types of function curves to suit your needs, including:

- Bezier function
- Velobased function

When you create a function to control a parameter over time (Scale, X, Y, Z, Rotate), you can use a Bezier function.

Bezier function

These function editors present different ways of editing the values over time. The shape of the created graph indicates the velocity of the function, regardless of the chosen editor. The type of function that you choose is largely based on your working preference.

You can also create Velobased functions for certain effects, like changes in rotation or size over time. When you do this, the Velobased functions are linked to the velocity of a 3D path. You cannot change the shape of a Velobased function to control its velocity.

With Velobased functions, you can link changes in rotation or scaling to the velocity of a 3D path. This makes it possible for changes in rotation or scaling to progress at the same speed as changes to the position of an element.

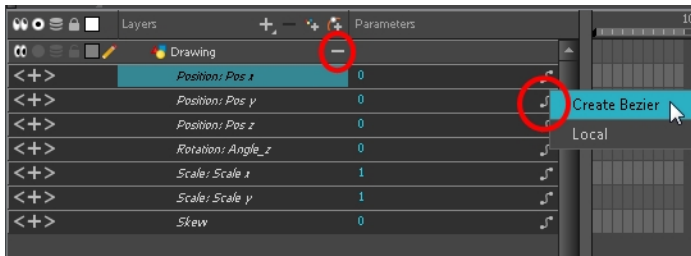

You can convert a Bezier functions so you can edit it using the controls offered by that type of function.

Creating Functions

You can create function curves in several different ways. You cannot create function curves directly in the Xsheet view. You must do this in the Layer Properties window or the Timeline view.

How to create the function curve in the Timeline view

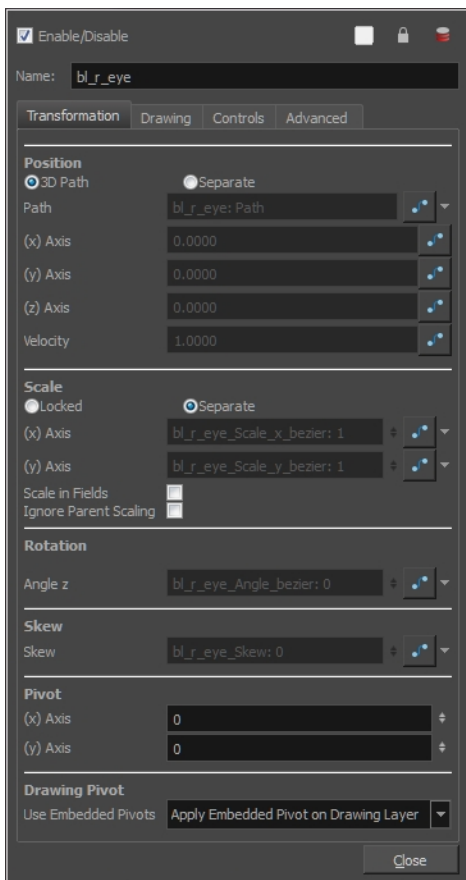

1. In the Timeline view, expand the layer's parameters.
2. Click the Function button and, in the drop-down menu, select **Create Bezier**.

How to create function curves using the Layer Properties view

1. In the Timeline view, double-click on the layer you want to create function curves for.

The Layer Properties Editor opens.

2. In the Transformation tab, click the Function Arrow button beside the local function information.
3. Create a 3D Path, Bezier, or Velobased curve.

You can click the Function  button to open the Function editor.

Sharing Functions

You can connect two or more functions to a shared function. If that shared function is modified, then the linked functions will vary accordingly.

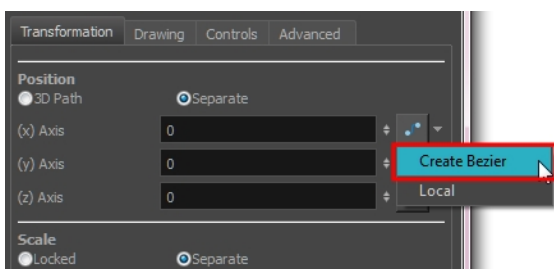

How to share a function using the Layer Properties editor

1. In the Timeline view, double-click on the layer that contains the function to share.

The Layer Properties window displays.

2. In the Transformation tab, click the Arrow button beside the function you want to share and select **Local**.

The function is shared with the other layers and parameters.

Shared functions are visible in the main section of the Xsheet view.

	Drawing_Pos_x	Drawing_Pos_y	Drawing_Pos_z	Drawing_Angle_	Drawing
1	0.000	0.000	0.000		1
2	-0.021		0.072		
3	-0.050		0.148		
4	-0.092		0.225		
5	-0.156		0.303		
6	-0.248		0.381		
7	-0.375		0.370		
8	-0.284		0.359		
9	-0.195		0.347		
10	-0.110		0.336		
11	-0.032		0.325		
12	0.038		0.314		
13	0.098		0.303		
14	0.146		0.291		
15	0.187		0.280		
16	0.177		0.269		
17	0.166		0.258		
18	0.156		0.247		
19	0.145		0.235		
20	0.135		0.224		
21	0.125		0.213		
22	0.114		0.202		
23	0.104		0.191		
24	0.093		0.179		
25	0.083		0.168		
26	0.072	0.000	0.157		1
27	0.062	0.000	0.146		1

3. From the same menu in which you chose the Bezier option (in our example), select the function you just shared and attach it to your parameter.

4. In the Timeline view, open the Layer Properties editor of the other layer that contains the parameters you want to link to the shared function.
5. In the Layer Properties editor or view, attach the parameter to the shared function the same way you did for the first layer.

The two parameters are both linked to the same function curve and follow the same path. If you modify the curve, both parameters will update.

About Copying Motions

In the Timeline view, you can easily drag keyframes to change the animation timing, delete them, cycle them and even copy them.

As you animate, you will find that you reuse many positions, drawings, and keys. However, you may only want to paste the drawings or just the keys or maybe everything. There are different paste options available in the Timeline view which give you maximum flexibility when reusing and pasting.

Note that these modes also apply when you drag instead of copying and pasting.

There are three different modes for pasting your selection:

- **Paste Mode: All Drawing Attributes:** Pastes the drawing exposure and keyframes.
- **Paste Mode: Keyframes Only:** Pastes only the keyframes.
- **Paste Mode: Exposures Only:** Pastes only the drawing exposure.

When you have position keyframes set in your drawing layer and you want to move them around when moving your drawing's timing, you can use the Paste Special feature to only move selected keyframes.

You can also use the Paste Cycle and Paste Reverse feature to cycle your selection including keyframes and drawings.

If you want to cycle a portion of your animation, you can use the Paste Cycle command. You can also use the Paste Reverse command to completely reverse the flow of your animation.

Using Timeline Paste Modes

Use can copy and paste or drag and drop keyframes and drawings in the Timeline view using various modes.

How to paste a selection using different modes

1. In the Timeline view, select the cells you want to copy and paste.

2. In the Timeline toolbar, click the desired Paste    mode button.
3. From the top menu, select **Edit > Copy Cells from the Timeline** or press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).
4. In the Timeline view's right side, select the cell on which you want to paste your selection.

5. Select **Edit > Paste Cells in the Timeline** or press Ctrl + V (Windows/Linux) or ⌘ + V (Mac OS X).

Paste Mode: All Drawing Attributes

Paste Mode: Keyframes Only

Paste Mode: Exposures Only

Using Paste Special

You can copy drawing exposures and keyframes and paste only a portion of your selection using Paste Special.

How to copy and paste a motion using Paste Special

1. In the Timeline view, select the keyframes to copy and paste. If you want to move the keyframes, go to step 3.

2. From the top menu, select **Edit > Copy Cells from the Timeline** or press Ctrl + C (Windows/Linux) or ⌘ + C (Mac OS X).
3. Edit your selection by doing the following:
 - To paste the selection, in the Timeline view, select the first cell on which you want to paste your keyframes and from the top menu, select **Edit > Paste Special** or press Ctrl + B (Windows/Linux) or ⌘ + B (Mac OS X).
 - To move the selection, in the Timeline view, drag the selection and hold down Alt. Drop the selection where you need it and release the hot key.

The Paste Special window opens.

4. Set the Drawing, Pegs and Functions, and Cycles parameters.
5. Click **OK**.

Cycling Animations

You can copy and cycle a section of your animation or your entire animation.

How to cycle an animation

1. In the Xsheet or Timeline view, select the cell range and keyframes to loop.
2. From the top menu, select **Edit > Copy Cells from the Xsheet/Timeline**.
3. In the Xsheet or Timeline view, select the cell on which you want the cycles to start.

4. From the top menu, select **Edit > Paste Cycle** or press **Ctrl + /** (Windows/Linux) or **⌘ + /** (Mac OS X).

The Paste Cycle dialog box opens.

5. In the Number of Cycles field, increase or decrease the number of cycles you want to paste.
6. In the Cycle Type, select the type of cycle to paste.

- **Normal (forward):** Pastes your selection as it is, starting with the first cell and ending with the last.
- **Reverse:** Pastes your selection reversed, starting with the last cell and ending with the first.
- **Forward > Reverse:** Pastes your selection as a yo-yo, starting with the first cell, going to the last one and ending with the first cell.
- **Reverse > Forward:** Pastes your selection as a reversed yo-yo, starting with the last cell, going to the first one and ending with the last cell.

Pasting Reverse Motions

You can paste your animation reversed from its original flow.

How to reverse the animation flow

1. In the Xsheet or Timeline view, select the cell range and keyframes to paste inverted.

2. From the top menu, select **Edit > Copy**.
3. In the Xsheet or Timeline view, select the cell on which you want the cycles to start.
4. From the top menu, select **Edit > Paste Reverse** or press **Ctrl + .** (Windows/Linux) or **⌘ + .** (Mac OS X).

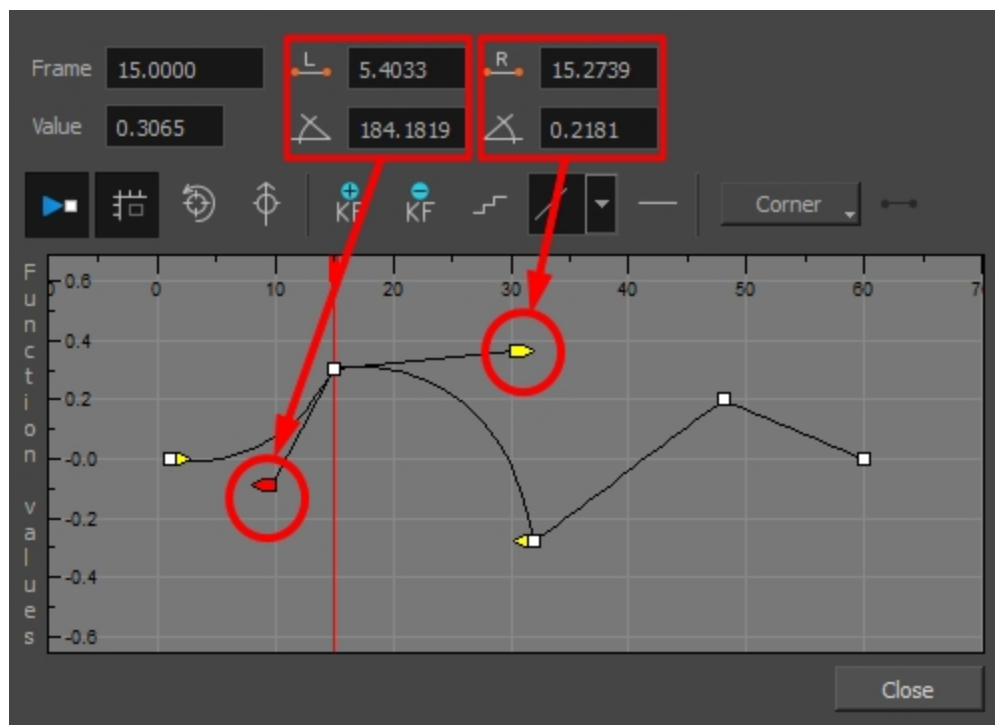

About Velocity

T-ANIMCO-001-009

To add ease in and ease out on motion paths, you can display the function curve and modify the Bezier or Ease curve. To apply ease to multiple functions and keyframes, you can use the Set Ease For Multiple Parameters script and set the amount.

The Velocity, or ease, is used on motion keyframes. The Velocity must be adjusted directly on the function curve in the Function view or Function editor. When a keyframe is selected, easing values appear in the right handle and left handle fields, as well as Bezier handle or Ease wheel controls on each selected keyframe. Pull on them to adjust the ease in and ease out, or type values in the fields.

You can reshape the velocity function using Bezier controls.

If you have several functions whose velocity you want to adjust at the same time, you can use the Set Ease for Multiple Parameters dialog box. It allows you to apply the same velocity parameters to all the selected keyframes in the same frame.

Displaying Velocity Curves

You can display a parameter's function curve and adjust the easing with the relevant controls.

How to display the velocity curve

1. In the Timeline view, click the Expand \pm button on a layer or press Alt + F.

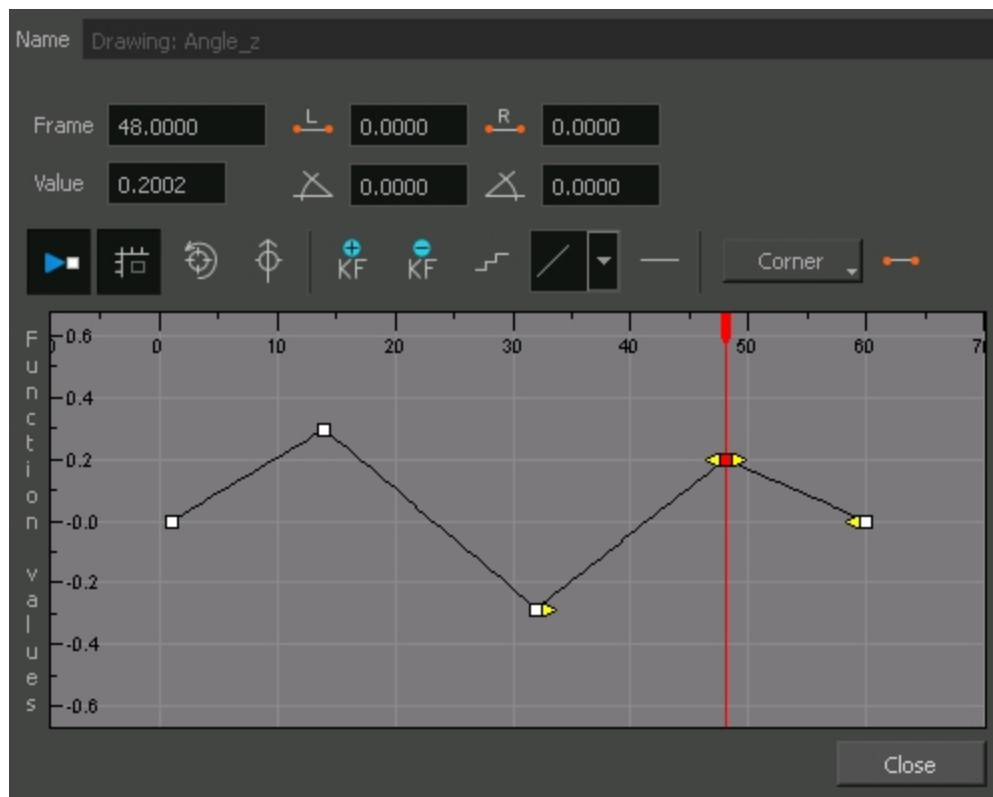

The layer's functions are displayed.

2. Double-click the desired function. Note that 3D Paths have a specific velocity curve controlling the X, Y, and Z axis together. You need to click on the `Position:Velocity` layer.

The Function Editor opens as the Bezier Editor.

The editor will not be displayed if the function does not already exist.

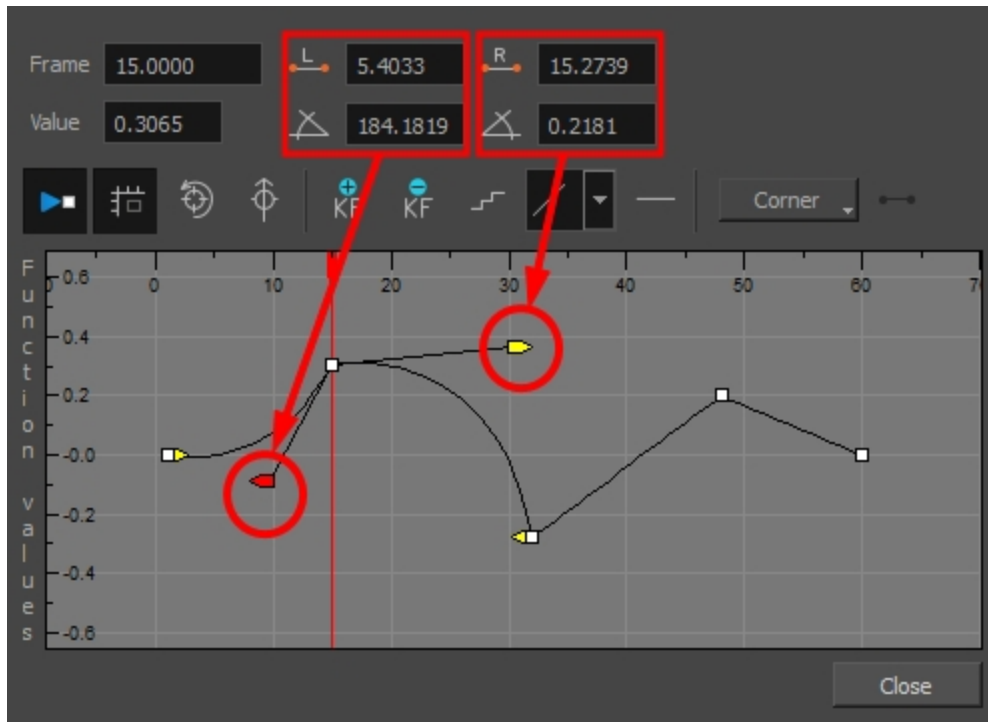

Adjusting Bezier Curve Velocity

You can reshape a Bezier curve velocity using the Function view controls.

How to adjust a Bezier curve velocity

1. In the Function view, select a keyframe.
2. Drag the controls to modify the shape of the curve.

You can reshape the function using the Bézier controls.

3. The Continuity options influence how you can move the handles:
 - **Straight:** Lets you move the handles together, maintaining the same angle to the point.
 - **Corner:** Lets you move the handles independently.
 - **Smooth:** Lets you move the handles together, maintaining the same distance and angle to the point.

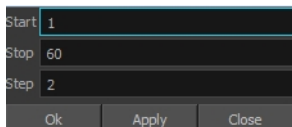

Creating Stepped Velocity

You can create a stepped curve to hold the same value over a selected number of frames. This works well when you are animating drawings on 2s, for example, and you want to hold the same value for a function over those two frames.

How to create a step velocity

1. Click the Hold Value Editor  button.

The Hold Value editor opens.

2. In the Hold Value Editor, enter the following values:

- **Start:** The starting frame for the effect.
- **Stop:** The last frame for the effect.
- **Step:** The number of frames to hold the value.

The function curve is updated based on the values you entered.

You can reshape the curve to create a linear velocity, so the values are interpolated (tweened) consistently between keyframes. That is, there is no acceleration in the effect.

How to create a step velocity for multiple parameters

1. Add the Scripting toolbar to your interface:
 - Go to the top menu and select **Windows > Toolbars > Scripting**.
 - Right-click on the empty space near the top of the interface and from the quick-access menu selecting **Scripting**.
 - Right-click on the empty space near the top of a view and from the quick-access menu selecting **Scripting**.
2. In the Scripting toolbar, click on the Manage Scripts  button to open the Scripts Manager window.
3. In the Scripts Manager, in the Files section, select the file `TB_CreateStepsOn.js`.

The functions associated with that file appear in the Functions section.

- In the Functions section, select **TB_CreateStepsOn**.

The Add script to toolbar ▷ button becomes active.

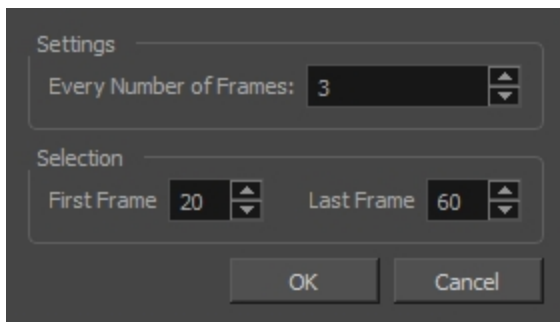

- Click on the Add script to toolbar ▷ button.

The TB_CreateStepsOn script ⚡ button is added to the Scripting toolbar.

- Click **Apply**.
- Click **OK**.
- In the Timeline view, select the layer whose parameter values you would like to hold.
- In the Scripting toolbar, click on the TB_CreateStepsOn script ⚡ button.

The Create Function Step On dialog box appears.

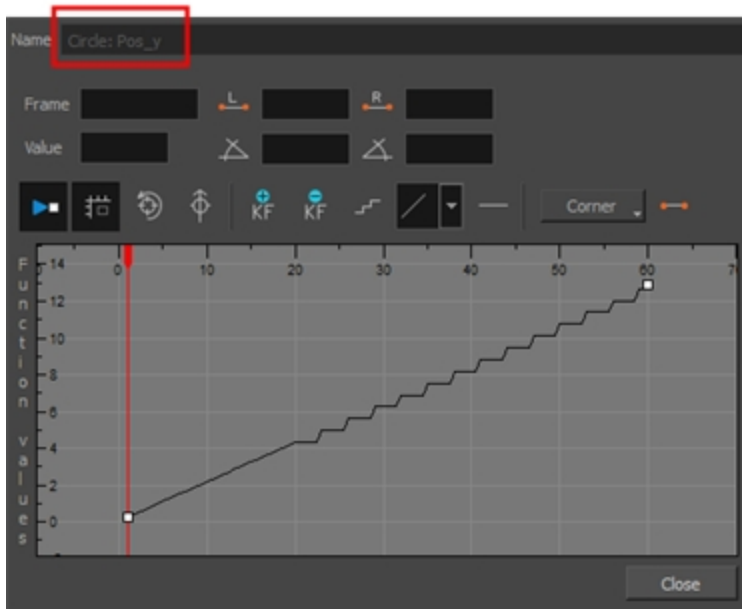

- In the Settings section, enter the hold value by changing the number in the Every Number of Frames field.
- In the Selection section, enter the first and last frame numbers to define the selection range.

NOTE: The playhead location determines the lowest value you can enter for the first frame, when defining the selection range. You need to move the playhead to frame one if you would like to set frame one as the lowest possible starting value.

12. Click OK.
13. In the Timeline view, expand the layer properties of the selected layer by clicking on its plus **+** button.

14. Double-click on a parameter layer to open its Bezier Editor. If that parameter was animated, the 3 frame hold from frame 20 to 60 was applied.

15. In the Bezier Editor, click on any of the keyframes to bring up the bezier point handles and use them to reshape the velocity curve for that parameter.

This means that multiple parameters can have the same stepped velocity, but have different ease-in ease-out curves defining that velocity.

Adjusting Velocity in the Timeline View

If you would rather avoid playing with graphs and function curves, you can adjust the velocity in the Timeline view.

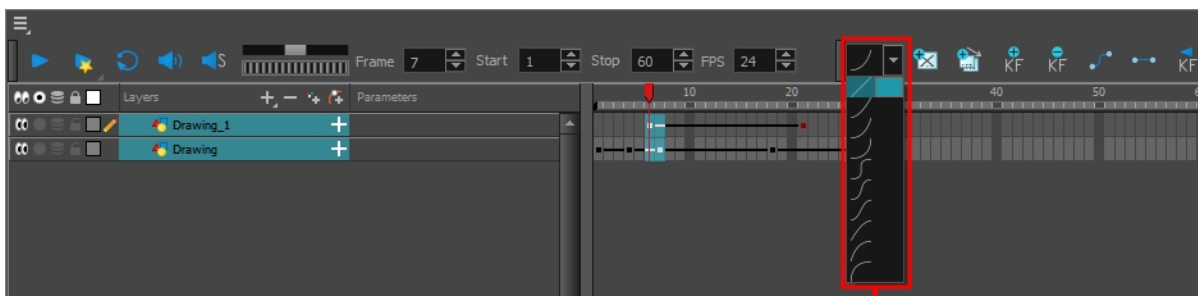

How to set the ease in the Timeline view

1. In the Timeline view, select a keyframe on one or more layers.

NOTE: Only the first selected keyframe will be considered when using the Set Ease For Multiple Parameter function. If many keyframes are selected on the same layer, the ease values will be applied only on the first keyframe and the rest will be ignored.

2. In the Timeline toolbar, select an option from the Set Ease Type menu.

Set Ease Type menu

NOTE: TIP: Optimize your workflow by adding the Apply Ease to Selection  button to the Timeline toolbar. This lets you quickly reapply the ease type without going through the Set Ease Type menu each time. To add the button to the toolbar, right-click on the toolbar area of the Timeline view and select **Customize**.

Setting Ease on Multiple Parameters

T-HFND-009-013

You can adjust the velocity on multiple parameters at a same frame for consistency.

How to set the ease on multiple parameters

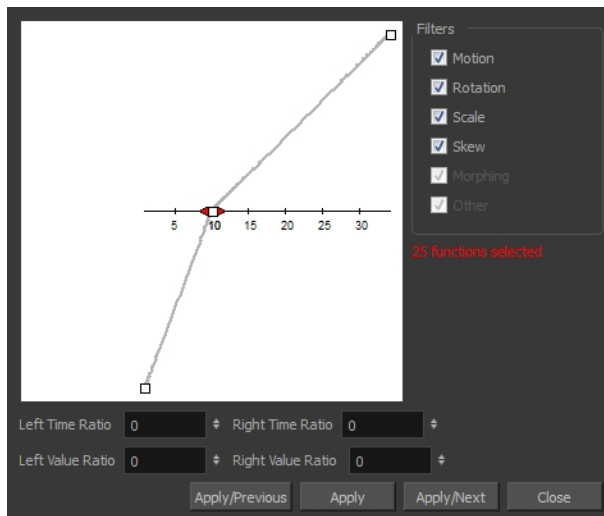

1. In the Timeline view, select a keyframe on one or more layers.

NOTE: Only the first selected keyframe will be considered when using the Set Ease For Multiple Parameter function. If many keyframes are selected on the same layer, the ease values will be applied only on the first keyframe and the rest will be ignored.

2. Do one of the following:
 - In the Timeline view, right-click and select **Set Ease For Multiple Parameters**.
 - In the Timeline toolbar, click the Set Ease For Multiple Parameters  button.

The Set Ease For Multiple Parameters dialog box opens.

3. In the graph, adjust the Bezier handles to change the velocity for all the selected functions.

4. In the Filters section, you can apply the easing parameters to a specific type of function only, such as Rotation or Scale. Deselect the function types you do not want to affect.
 - **Motion:** Applies the easing parameters to the selected Position X, Position Y, Position Z and 3D Path functions.
 - **Rotation:** Applies the easing parameters to the selected Angle functions.
 - **Scale:** Applies the easing parameters to the selected Scale functions.
 - **Skew:** Applies the easing parameters to the selected Skew functions.
 - **Morphing:** Applies the easing parameters to the selected Morphing Velocity functions. Note that it applies to the Morphing velocity function found in the Layer Properties window, not the basic morphing ease in the Tool Properties view.
 - **Other:** Applies the easing parameters to all the other the selected functions, such as all functions created to animate effect parameters.

5. You can also adjust the easing by typing values in the Time and Value Ratio fields. The values are calculated in percentage.
 - In the Left Time Ratio and Right Time Ratio fields, type the percentage value corresponding to the length of time you want the easing to last. Stay between 0% and 100%. If you go beyond 100%, your motion will overshoot.
 - In the Left Value Ratio and Right Value Ratio fields, type the percentage value of how strong you want the easing out to be. Stay between 0% and 100%. If you go beyond 100%, your motion will overshoot.
 - If your Time Ratio and Value Ratio values are equal, you will have a linear motion.

6. Once done, click one of the following:
 - **Apply/Previous:** Applies the easing parameters to the selected keyframes and then selects the previous keyframe in the timeline.
 - **Apply:** Applies the easing parameters to the selected keyframes.
 - **Apply/Next:** Applies the easing parameters to the selected keyframes and then selects the next keyframe in the timeline.
 - **Close:** Close the dialog box. If you did not apply the modifications, they will be cancelled.

About Animation Resources

As you are animating, you might find that you are constantly selecting the same elements from your scene, in order to progressively move and manipulate them. You can create a preset for almost any selection or group selection in your scene, in order to speed up the animating process.

Chapter 17: Cameras

T-HFND-009-001

Harmony contains a camera that can move along the X, Y, and Z axes. Having the camera move on the Z-axis offers the possibility to create truck in and truck outs, as well as multiplane camera moves. The default camera position is centred and backed up to 12 fields.

It is important to understand the coordinate values in Harmony, which is based on the origins of animation. In traditional animation, a scene's size and camera motion are calculated in fields. A field has a 4:3 ratio and measures 0.5 inches (12.7 mm) in width. A specific grid has been created for this purpose known as a *field chart*. Harmony uses this unit of measurement as its coordinate system.

A field chart uses the cardinal directions. The X axis is the east-west (left-right) direction, the Y axis is the north-south (up-down) direction and the Z axis is the forward-backward direction.

The scene action occurs inside the camera frame, so it's really important to set it up correctly. You can adjust the camera resolution and other parameters in the Scene Settings window.

By default, a scene does not have a camera layer. In order to be able to tweak the camera's angle and position, you must add one to your scene. Although it is possible to have several cameras in the same scene, you can only view your scene using one camera at a time. This can be useful if you are still working on your scene composition and have different camera framing to try out.

The Camera layer is static which means that if you need to animate it, you must put it under a parent peg.

You can reposition your camera frame directly in the Camera view, using the advanced animation tools. Another way to set up your camera frame is to type the coordinates directly in the camera's properties. Doing this positions the camera precisely where you want it to be rather than gauging it visually.

You can change the near and far clipping planes of the camera. The near plane is the point on the camera cone where the camera is located. The far clipping plane is the far end of the camera cone. Nothing outside that range is visible. This is useful when dealing with 3D elements and 3D sets. For example, the camera can be looking inside a 3D box or room and you might want the foreground wall to not obstruct the view of the interior. By default, the near clipping plane is set to 1 field and the far clipping plane is set to 1000 fields.

Adding a Camera

T-HFND-009-002

By default, there is no camera in the scene. The frame visible in the Camera view is only a reference based on your project's resolution. In order to position your camera, you must add one to your scene.

How to add a camera in the Timeline view or Top menu

1. Do one of the following:
 - In the Timeline view, click the Add Layer **+** button and select **Camera**.
 - From the top menu, select **Insert > Camera**.

A new camera layer is added to the scene and appears in the Timeline view.

Selecting the Active Camera

T-HFND-009-003

You can add multiple cameras to your scene, but only one can be active at a time. You can select your active camera from the Camera list.

How to select the active camera from the Camera list

1. From the top menu, select **Scene > Camera > *camera***.

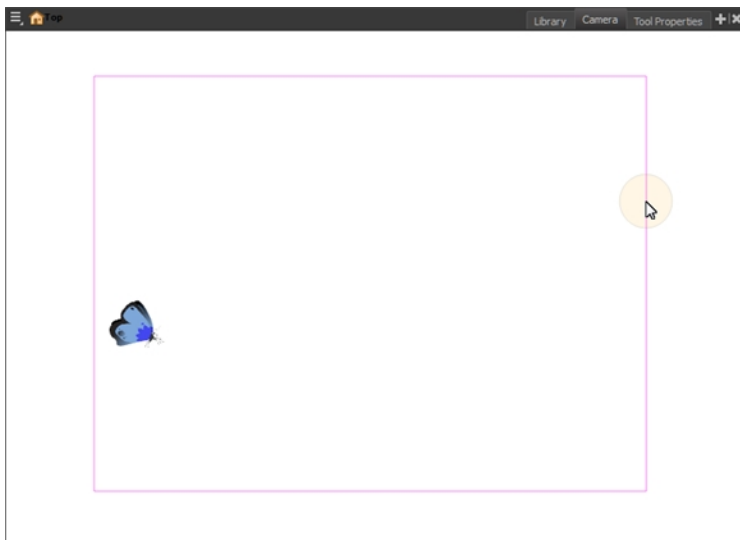

Positioning the Camera Frame

You can grab the camera frame and move it around in the Camera view. You can also setup the camera position by entering coordinates and values in the Layer Properties view.

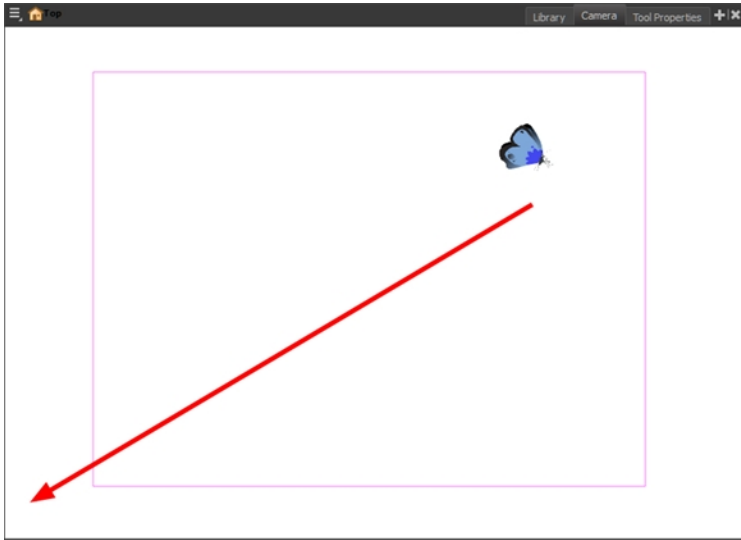

How to reposition the camera frame in the Camera view

1. In the Tools toolbar, disable the Animate  mode.
2. Do one of the following:
 - From the top menu, select **Animation > Tools > Translate**.
 - In the Advanced Animation toolbar, click the Translate  tool.
 - Press Alt + 2.
3. In the Camera view, click on the camera frame (thin rectangle) to select it. You can also select the camera layer from the Timeline view.

The selected camera frame is highlighted.

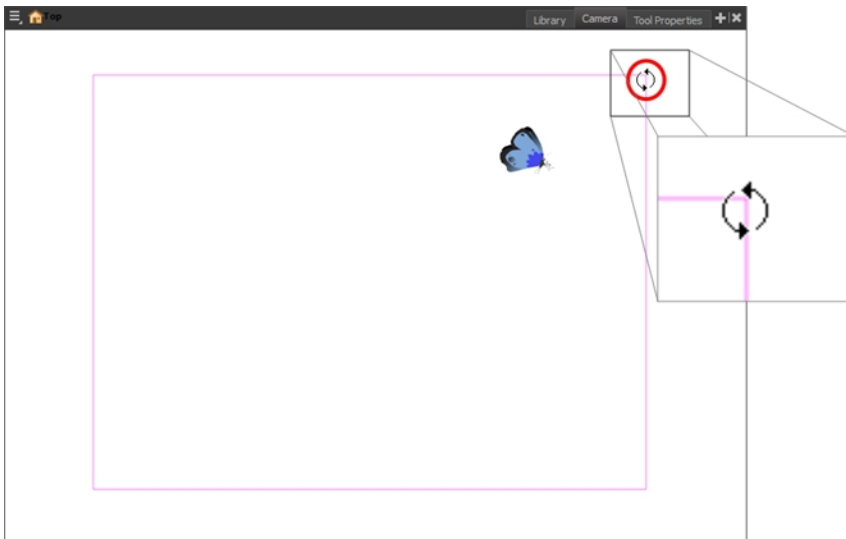

4. Drag the camera frame to a new position.

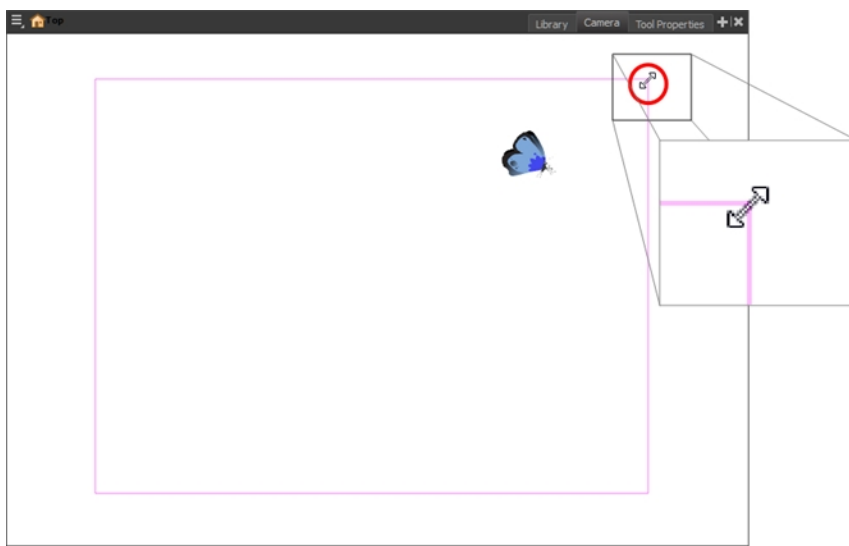

5. To tilt the camera frame, do one of the following to select the Rotate tool:
 - From the top menu, select **Animation > Tools > Rotate**.
 - In the Advanced Animation toolbar, select the Rotate  tool.
 - Press Alt + 3.

6. In the Camera view, drag to rotate the camera frame until it reaches the desired rotation angle.

7. To move camera frame closer to or further away from the scene, do one of the following to select the Scale tool:
 - From the top menu, select **Animation > Tools > Scale**.
 - In the Advanced Animation toolbar, select the Rotate  tool.

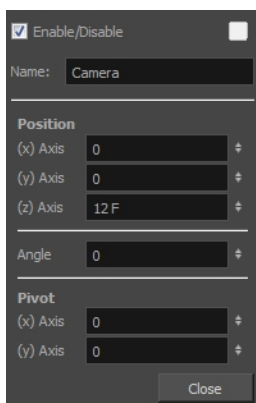

- Press Alt + 4.

NOTE: The Transform tool can also be used to move the camera, but not to rotate or scale it.

How to set up the camera frame using the Layer Properties view

1. In the Timeline view, select the camera layer.
2. In the Layer Properties view, adjust the camera's properties.

3. Type or use the numeric stepper to adjust the coordinate and angle values—see the Reference guide .

Resetting the Camera Position

You can easily reset the camera to its original position. Using the Reset command, you can reset the value of the selected element to the initial value of the active tool. For example, if the Rotate tool is active, the transformation angle will be reset to 0 and if the Transform tool is active, then all parameters values will be reset.

How to reset the camera position

1. In the Tools toolbar, select the Transform  tool or press Shift + T. If you want to reset a single parameter, select the corresponding Advanced Animation tool, such as the Rotate  tool.
2. In the Timeline or Camera view, select the camera layer.
3. From the top menu, select **Animation > Reset** or press Shift + R.
The camera automatically returns to its original position.

Animating the Camera

T-HFND-009-009

A scene's camera can be manipulated and animated just like any other layer. It is listed in the Timeline view and you can use the same tools and selection modes to offset or animate it. However, the camera layer itself is static, which means it keeps the same position and angle throughout the whole scene. In order to be able to animate the camera, you need to connect it to a peg layer, which can be animated, and which will directly affect the position and angle of the camera.

You can animate your camera movements directly in the Camera view. Alternatively, you can use the Side or Top views, which can be especially useful when animating a camera in a multiplane scene.

How to animate the camera

1. In the Tools toolbar, enable the Animate  mode.
2. In the Tools toolbar, select the Transform  tool or press Shift + T.
3. In the Timeline view, select the Camera layer.

4. From the Layers toolbar, click the Add Peg  button.

A Peg layer appears directly above the Camera layer, which is automatically attached to it.

The Peg layer automatically takes the name of the camera and adds the suffix **-P** to indicate that it is a Peg layer, for example **Camera-P**.

Collapsed Peg layer

Expanded Peg layer

5. On the right side of the Timeline view, on the Camera Peg layer, select the frame at which you want the camera movement to start.

6. Do one of the following to add a keyframe:

- In the Timeline toolbar, click the Add Keyframe  button.
- Right-click and select **Add Keyframe**.
- Press F6.

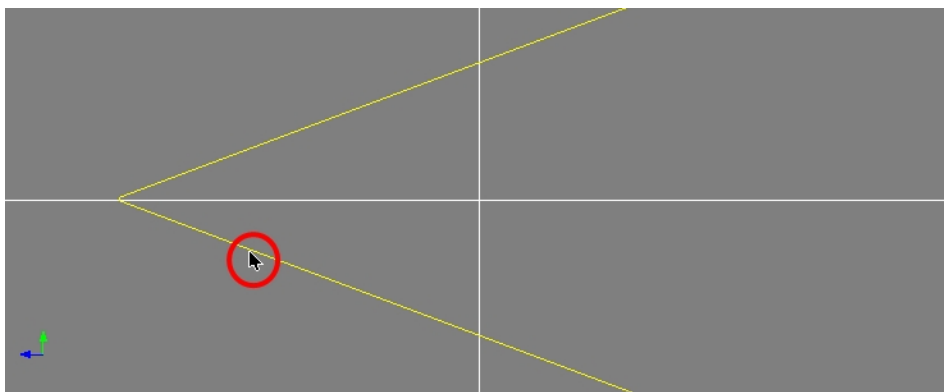

A keyframe appears in that cell. Any frames preceding this keyframe cell will hold the same camera position as this keyframe.

7. Do one of the following to move the camera:
 8. In the Camera view, select the Camera, which should now be represented by a thin yellow rectangle with a red highlight, and move it to the desired position. Do one of the following to select In the Top, Side or Camera view, select the camera (the large V-shaped cone) and move it to the desired position. In the Camera view, the camera is represented by a thin frame. You need to click directly on one of the edges.
 - In the Camera view, select the Camera, which is now be represented by a thin yellow rectangle with a red highlight, and move it to the desired position.

- In the Top or Side view, select the camera, which is now represented by a large, yellow V-shaped cone, and move it to the desired position.

9. On the Timeline view, click on the cell where the camera move will end.
10. Do one of the following:
 - In the Timeline toolbar, click the Add Keyframe  button.
 - Right-click and select **Add Keyframe**.
 - Press F6.

A keyframe appears in that cell.

11. Select the camera in the Camera, Top or Side view and move it to the desired position.
12. In the Timeline view, select the first frame to rewind to the beginning of your animation.
13. In the Playback toolbar, click on the Play  button to preview your animation.

Animating the Line Thickness on Camera Move

As you move the camera in your scene along the Z-axis, notice that, logically, the lines of the elements become thicker the closer the camera gets to the drawing. If you prefer the lines to remain the same size or become thicker at a different speed, you can use the thickness feature to adjust your brush stroke and pencil line thickness. You can modify the size of the lines even if the camera is not animated.

NOTE: This feature can only be viewed in the Camera view's Render mode.

How to adjust the pencil line thickness of a drawing layer in the Camera view

1. In the Timeline view, double-click on a drawing layer to display the Layer Properties window.
2. Select the **Advanced** tab.
3. In the Line Thickness section, adjust some of the following parameters until you achieve the desired effect.

- **Adjust Pencil Lines Thickness:** Lets you work with pencil lines and adjust their thickness. You will not see any changes to lines in the Camera view OpenGL mode. You must switch to the Render mode.
- **Normal Thickness:** Disables all overrides on the brush stroke line thickness. This option must be enabled in order for the pencil line thickness parameter and pencil lines to appear. If you want to modify the brush stroke thickness, deselect this option. To enable brush strokes to work with the line thickness feature, you must first create central strokes in the Colour Art layer. The central strokes control the line variation of your brush strokes in the Line Art layer. Select **Drawing > Create Colour Art from Line Art**.
- **Zoom Independent Thickness:** Select this if you want your line thickness to remain constant independently from the camera move. Everything else will increase in size, but the line thickness will stay the same.
- **Proportional:** Enter a multiple by which you want to increase the line thickness base on its original thickness. A value of 1 will result in no change; a value of 0 (zero) will hide the lines.
- **Constant:** Enter a value in pixels (based on a 720x540 screen resolution) to indicate the amount of pixels you want to add around the existing line.
- **Minimum:** Enter a value in pixels (based on a 720x540 screen resolution) for the minimum line thickness allowed.

- **Maximum:** Enter a value in pixels (based on a 720x540 screen resolution) for the maximum line thickness allowed.

Chapter 18: Sound

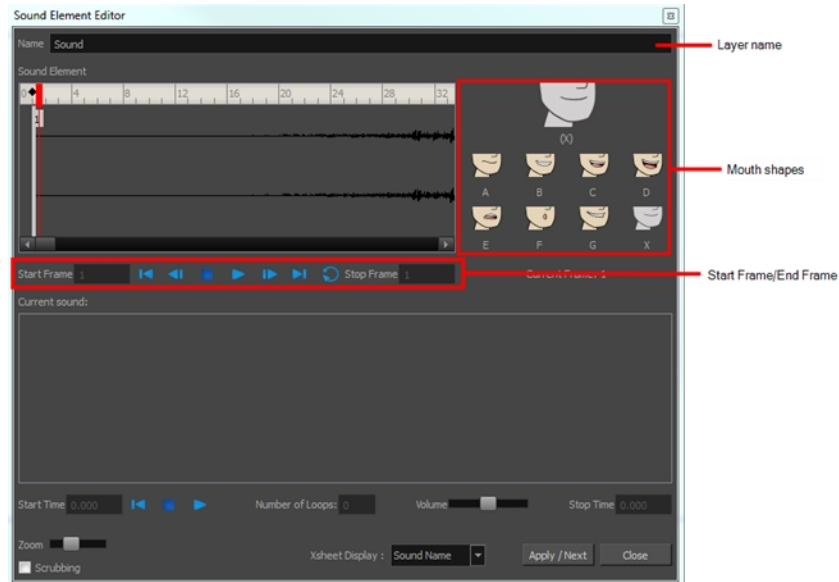

With Harmony, you can import soundtracks and dialogue into your animation. There are several sound editing features you can use to synchronize sounds to individual frames or moments in time. You can also edit them to trim unwanted seconds from the beginning and end of your sound files, as well as loop sounds that you want to continue throughout your animation.

Your ability to add dialogue to animation is greatly enhanced with the Harmony automatic lip-sync detection. Harmony can analyze voice tracks to determine which of the eight animation phonemes (lip positions) would best apply to each frame of sound. With the mouth chart that is generated, you can easily draw lip positions for your character. Furthermore, Harmony can automatically apply drawings of lip positions to each frame of your animation based on the mouth chart.

About the Sound Editor

When you double-click on a sound layer in the Timeline view, the Sound Element Editor appears.

- **Mute/Unmute:** This button mutes and unmutes the sound layer during the scene play back.
- **Layer Name:** This field displays the layer's name.
- **Sound Editor:** This button opens the Sound editor.
- **Start Frame/End Frame:** These fields determine the start and end frame of the sound file.
- **Detect:** This button launches the automated lip-sync detection.
- **Map:** This button opens the Map Lip-sync dialog box.
- **Mouth Shapes:** This section shows the automated lip-sync detection during the scene play back. Click on the thumbnail image of each mouth to change the phoneme assigned to the current frame.

Sound Layer Properties

When you select a sound layer in the Timeline view, the options related to that layer appear in the Layer Properties view.

Importing Sound

T-HFND-007-009

If you wish to add sound to your animation, you should first edit and mix your sound files in a sound editing software. It is recommended to mix down your sound into full length sound tracks so that you can work with the exact same sound track in the different applications used for your production.

Sound can be clipped in Harmony if needed. Importing a soundtrack longer than your scene will not extend your scene's length. Sound playback will stop at the end of your scene's length.

If you create your project in Toon Boom Storyboard Pro, you can export all of your project's scenes as separate Harmony scenes. The storyboard's sound track will be cut up by scene and each piece will be inserted into the exported scenes, allowing you to save time on splitting and importing your sound track.

Harmony can import .wav, .aiff and .mp3 audio files. It is recommended to work with .wav and .aiff files if possible.

How to import a sound file

1. Do one of the following:
 - From the top menu, select **File > Import > Sound**.
 - In the Xsheet view, right-click anywhere in the frame area and select **Import > Sounds**.
 - From the Xsheet menu, select **File > Import > Sounds**.
 - From the Timeline menu, select **Import > Sounds**.

The Select Sound File dialog box opens.

2. From the Select Sound File dialog box, find and select a sound file.

The sound file appears as a layer in the Timeline view. Its waveform is displayed in the track to help you visualize at which frames the sound effects in your soundtrack occur.

Your soundtrack also appears as a column in the Xsheet view, but will not display a waveform by default. If you wish, you can display a sound column's waveform by right-clicking on it, then selecting **Sound Display > Waveform**.

Playing Sound

T-HFND-007-010

Before playing back any sound, click the Enable Sound  button in the Playback toolbar or enable it through the Play menu (in the top menu). This will ensure that you can hear the sound layers in your scene, even the ones included within symbols.

If there are two or more sound layers and you want to listen to them independently, you can disable the unwanted sound by clicking the Disable Layer  button on the sound name layer in the Timeline view.

If you are trying to do a playback with sound and the frame rate doesn't reach 24 fps (frame per second), you can do one of the following to troubleshoot the issue:

- Shrink down the Camera view size to reduce the cached image size.
- Playback your scene without sound first, then add the sound. If you do not cache the images first without sound, the playback will try to follow the sound by skipping images that will never get cached.
- In the Preferences panel, in the OpenGL tab, reduce the size of the Playback Cache Size (in mb) preference.

How to play back sound

1. To select a starting point:
 - In the Xsheet view, click on a cell in the sound column.
 - In the Timeline view, click on a cell in the sound layer. You can also slide the red playhead to the correct cell.

2. In the Playback toolbar, activate the Enable Sound  button.
3. Do one of the following:
 - Click the Play  button in the Playback toolbar.
 - From the top menu, select **Play > Play** or click on the Enter/Return key.
4. To hear the sound played back again and again, do one of the following:
 - Click the Loop  button in the Playback toolbar
 - From the top menu, select **Play > Loop**.
5. To mute soundtrack, on the left side of the sound layer, click the Disable Layer  button.

Changing the Sound Display

Within the Xsheet view, you can display the sound file in different ways, depending on your sound editing needs.

You can show or hide the waveform in the Timeline view by selecting the **Waveform**  button in the Timeline View toolbar. You must customize the toolbar to display this button because it is not included in this toolbar by default.

How to change the sound display in the Timeline view

1. In the Timeline view's right area, right-click in the frame section and select **Show Sound Waveforms** or in the Timeline view menu, select **View > Show > Show Sound Waveforms**.

- You can change the waveform scale using the **Zoom Waveform**  icon on individual sound layers in the Timeline view's left side.

How to change the sound display in the Xsheet view

1. Right-click in the sound column or on the sound column header, and select **Sound Display** and one of the following:
 - **Sound Name:** Shows the name of the sound file, as well as the file format. The line running vertically through the column frames between the same file name indicates a continuity of the same sound file in these frames.
 - **Mouth Shapes:** Shows the letter (or name depending on the way you named your character's different mouth positions) in the column's frames. There is only one mouth position allotted per frame and this position should correspond to the sound file after performing a lip-sync.
 - **Waveform:** Shows a vertical display of the sound file's actual waveform. In the column header, in the field under the column name, you can type in a percentage to zoom in or zoom out on the waveform, or pass the scroll cursor  over the **Zoom Waveform**  icon.

	Sound_Name	Mouth_Shapes	Waveform	
28	Sound_Name.wav	X		
29		X		
30		X		
31		X		
32		X		
33		X		
34		X		
35		X		
36		X		
37		X		
38		X		
39		X		

Sound Scrubbing

Harmony uses a process known as Sound Scrubbing to let you hear sound in real-time while you move the playback pointer forward or backward. This is very useful for finely-tuned lip-synching. You can scrub sounds from the Timeline view.

How to scrub a sound from the Timeline view

- Do one of the following:
 - From the top menu, select **Play > Enable Sound Scrubbing**.
 - Right-click in the frame bar of the Timeline view and select **Play > Enable Sound Scrubbing**.
 - In the Playback toolbar, enable the Sound Scrubbing  button.

- At the top of the Timeline view, drag the red playhead to hear the sound at each frame.

- In the Playback toolbar, you can use the jog slider to playback forward and backward subsequent sound frames. This allows you to do a more fluid scrubbing.

About Analog Sound Scrubbing

Harmony is set to the digital sound scrubbing mode by default. This means that all sounds are played in real time. It also means that as you scrub over a frame, you will hear the section of your sound file that is allotted to that frame. As you are scrubbing, although it is accurate, the sound can sound clipped. It can also be difficult to hear nuances in pitch and tone.

Harmony has an analog sound scrubbing option. When sound scrubbing in this mode, the sound is played back according to the speed that the playhead or jog is manually adjusted. Harmony's interface offers shuttle and jog sliders to perform analog sound scrubbing, however, external hardware and their corresponding software can be used in conjunction with Harmony for improved analog sound scrubbing results.

NOTE: Refer to the device's manual to configure its functionality with Harmony.

Performing an Analog Sound Scrub in Harmony

Before you can perform an analog sound scrub in Harmony, you have to learn about the Shuttle and Jog controls.

- **Shuttle:** Pull the Shuttle control backward or forward to make the red playhead in the Timeline view jump by large increments in the direction you are moving the shuttle.
- **Jog:** Drag the Jog control to make the "dial" rotate. The Jog controls finer incremental movements along the soundwave. Use the Frame field to see the frame number which you are on. As you rotate the dial, your speed in fps appears directly after the FPS field.

How to perform an analog sound scrub

1. Do one of the following:
 - ▶ From the top menu, select **Play > Enable Sound Scrubbing**.
 - ▶ Right-click in the frame bar of the Timeline view and select **Play > Enable Sound Scrubbing**.
 - ▶ In the Playback toolbar, enable the Sound Scrubbing  button.

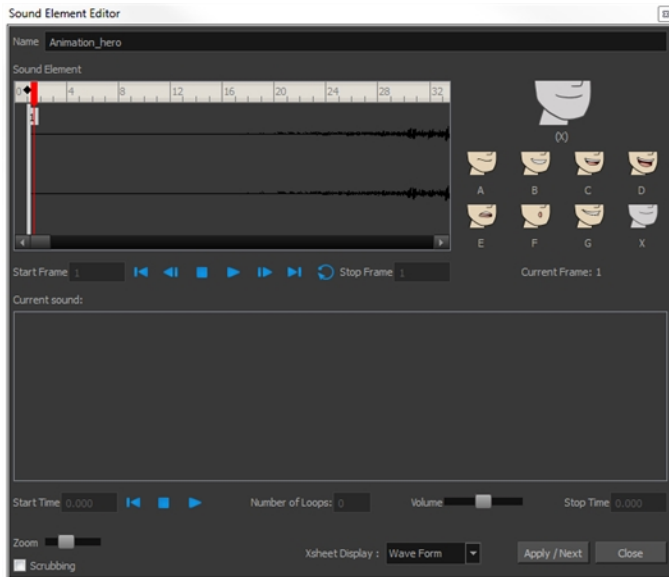

2. In the top menu, select **Edit > Preferences** (Windows) or **Harmony Advanced > Preferences** (Mac OS X).
3. In the Sound tab, select the **Analog Sound Scrubbing** option.
4. Click **OK**.
5. Do one of the following:
 - ▶ In the Playback toolbar, use the Shuttle to find the general location of where you want to start your sound scrub.
 - ▶ In the Timeline view, drag the red playhead to the desired location.
6. In the Playback toolbar, use the Jog to fine-tune your scrub to just a few frames.

Editing Sound

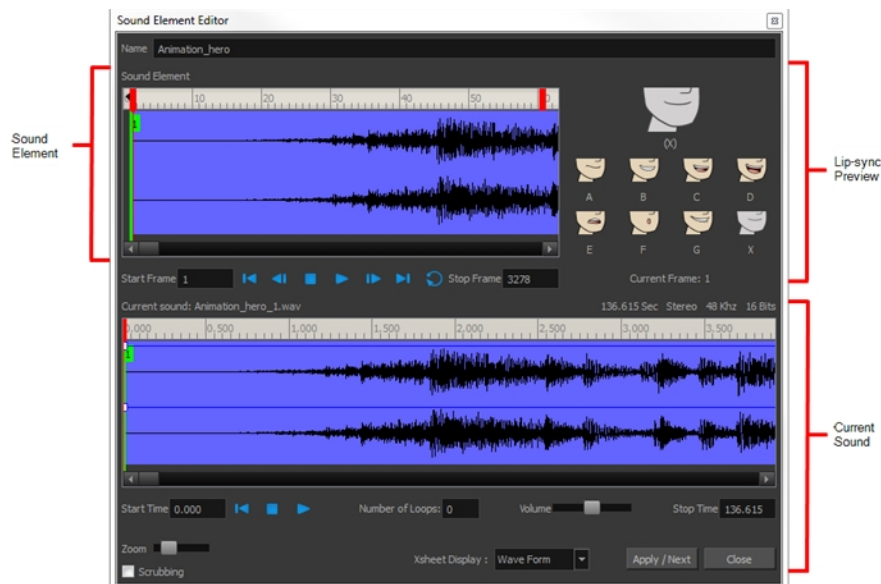

Now that you have successfully imported a sound file into Harmony, it is time to familiarize yourself with the sound editing interface. The Sound Element editor makes it possible to edit sounds that were created outside of Harmony and imported into your scene.

How to open the Sound Element editor

1. Double-click on the sound layer name in the Timeline view or the sound column header in the Xsheet view.
The Sound Element Editor dialog box opens.

The Sound Element editor consists of three main parts.

- **Sound Element:** The waveform in the Sound Element Editor is the actual sample that will be heard when the final movie is rendered. It may be shorter than the original sound sample due to the length of the scene. If any

edits are made to the sound sample, they can be heard here. In the Sound Element panel, notice the coloured tabs that indicate the start and end frames of a sound segment. The frame number is displayed in the tab.

- **Current Sound:** Displays the original sound file in its entirety and is where you can edit its properties. This window remains empty until you click inside the Sound Element Editor.
- **Lip-sync Preview:** Lets you preview the automated detection and to manually insert different mouth positions to correspond with the sound sample.

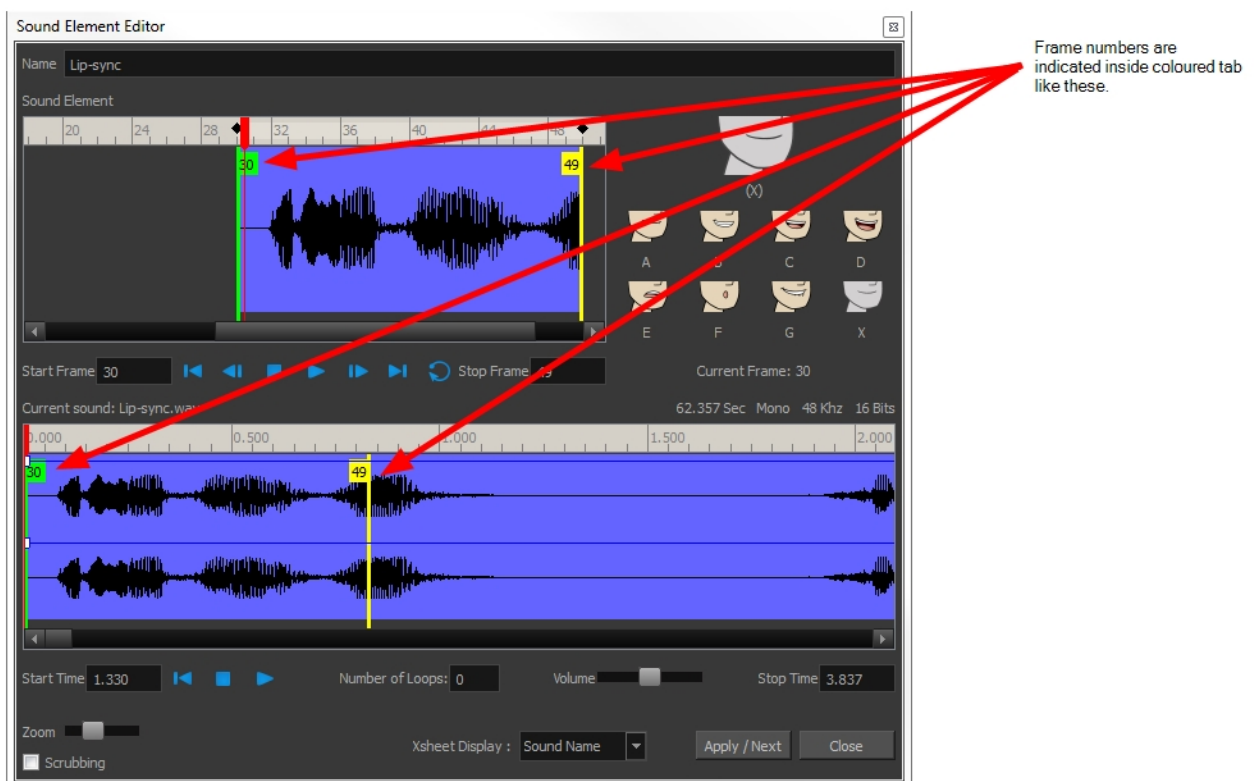

Cropping Sound

To synchronize the sound with specific images in your scene, you must set a start frame for your sound. To make sure the sound ends by a certain frame, you must set an end frame.

In the Sound Element panel you will see some coloured tabs, these tabs represent the frames. The frame number is shown inside the tab flag marker. These tabs indicate the start and end frames of a sound segment.

How to change start or end frame of a sound

1. Double-click on the sound layer name in the Timeline view or the sound column header in the Xsheet view.
2. In the Sound Element editor, select a sound sample from the Sound Element section. To distinguish one sound section from another on the same sound layer, check the frame numbers that appear on tabs flanking the start and stop lines of each waveform section.

Click the Play ► button in the Current Sound section (only the selected sound plays).

3. Within the Sound Element panel, drag the selected clip to the frame number where you want it to start playing.

You can only move the clip to a section that does not already contain a clip; you cannot overlap two clips in the same element.

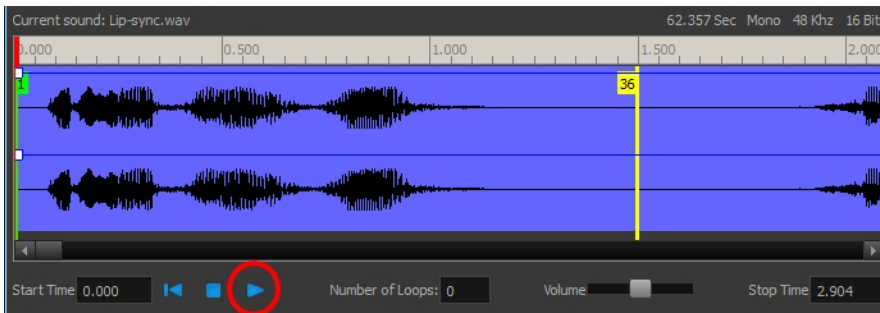

4. To change the end frame, drag the yellow marker at the end of the waveform to the frame position.

5. To hear how all the clips fit together in the element, click the Play button in the Sound Element section.

If you only want to hear the selected clip, click the Play button in the Current Sound section.

6. Click **Apply/Next**.

The Xsheet and Timeline views display the sound clip at the start frame you selected.

Trimming Sound

To play only a section of a sound file, use the Sound Element editor to select the exact part you want to use. For example, if there is a bit of noise at the start of the sound, use the Sound Element editor to cut the noise.

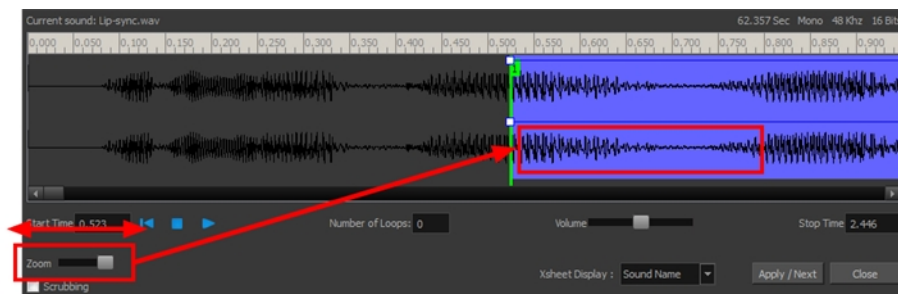

The Sound Element Editor does not change the original sound file; it only plays a section of it, ignoring the rest. This means that the entire sound file is included on export. If you need to be mindful of file size, it is better to edit sound files completely in a sound editor before bringing them into Harmony.

How to trim the start and end of a sound file

1. Double-click on the sound layer name in the Timeline view or the sound column header in the Xsheet view.
2. In the Sound Element editor, select a sound sample from the Sound Element section. To distinguish one sound section from another on the same sound layer, check the frame numbers that appear on tabs flanking the start and stop lines of each waveform section. Or select a soundwave and click the Play ► button in the Current Sound panel (only the selected sound plays).
3. Using the Current Sound section, decide on the part of the file you want to play by dragging the left and right boundaries of the selection area.

4. Click the Play ► button in the Current Sound section to check that you have trimmed the desired sections. Use the Zoom slider at the bottom of the panel to zoom in on the waveform so you can trim it more accurately.

5. Click **Apply/Next**.

The trimmed sound sample appears in both the Timeline and Xsheet views at the start and end positions you selected.

Looping Sound

To repeat a sound, specify the number of times that you want it to loop in the Sound Element editor.

How to loop a sound sample

1. Double-click on the sound layer name in the Timeline view or the sound column header in the Xsheet view.
2. From the Sound Element section, select the sound section you want to loop.
3. In the Current Sound section, type the number of times you want the sound to play in the Number of Loops field.

4. Press the Enter/Return key.

The looped sound appears after the current sound. They are indicated by their grey waveforms, as opposed to black.

When you loop a sound, the looped sections fill the cells in the sound element (column or layer) until the next sound sample starts or until the scene ends. This means that the looping could be cut if the next sound sample starts too soon or if the scene ends too quickly.

Mixing the Sound Volume

You can adjust the volume of an entire sound clip or modify the volume in increments by adjusting the fade-in and fade-out times, otherwise known as sound envelopes. The fade edit only affects the playback; the original sound file is not affected.

How to adjust the overall volume of the entire sound clip

1. Double-click on the sound layer name in the Timeline view or the sound column header in the Xsheet view.
2. In the Sound Element section, select the sound you want to work on.

A more detailed version of the selected sound appears in the Current Sound section.

3. In the Current Sound section, use the Volume slider to adjust the volume.

4. Click the Play ► button in the Current Sound panel to verify the volume.

How to create the fade in/out effect on a sound clip

1. Double-click on the sound layer name in the Timeline view or the sound column header in the Xsheet view.
2. In the Sound Element section, select the sound you want to work on.
3. In the Current Sound section, click on the thin blue line above the waveform to add an envelope marker.

4. Drag the envelope markers to adjust the volume at that frame and to create the time of the transition. The line from the edge of the clip to the envelope marker identifies how the volume increases (fades-in) or decreases (fades-out) over time.

Dragging the marker to the bottom of the channel mutes the volume, while dragging it upwards increases the volume.

NOTE: To create an even effect, be sure to adjust the envelope markers uniformly in both the left and right (bottom and top) channels.

5. Click the Play ► button in the Current Sound panel to check the fade envelopes.

Setting the Playback Range

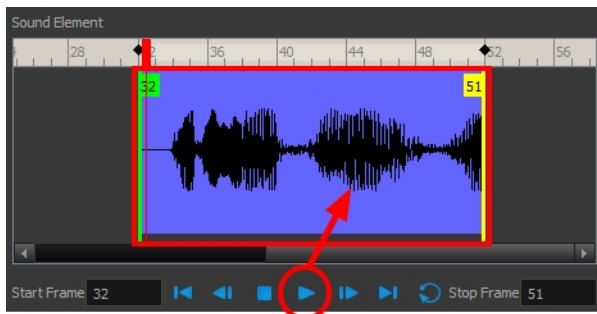

To hear a specific section of the sound element, adjust the playback range in the Sound Element editor to start or stop at specific frames. This customized playback range does not affect the actual sound in the Sound element.

How to change the playback range in the Sound Element editor

1. Drag the start or end range markers in the Sound Element section to the boundary frames you want.

2. When you click the Play ► button to play back your sound in the Sound Element editor, it only plays the sound which exists between the two markers.

Adding an Empty Sound Layer

When performing sound editing tasks, it can be useful to chop up a sound sample into different layers. For example, when performing a lip-sync, only a single view of the various mouth positions for a character can exist on one layer. Therefore, if you want to have a character turn its head from a profile view to a three-quarter view and have mouth position changes to fit with the sound sample from these two different views, you would need to cut up the sound samples needed for the profile view mouth positions on one layer and the sound samples needed for the three-quarter view on another.

For this task, you will need an empty sound layer.

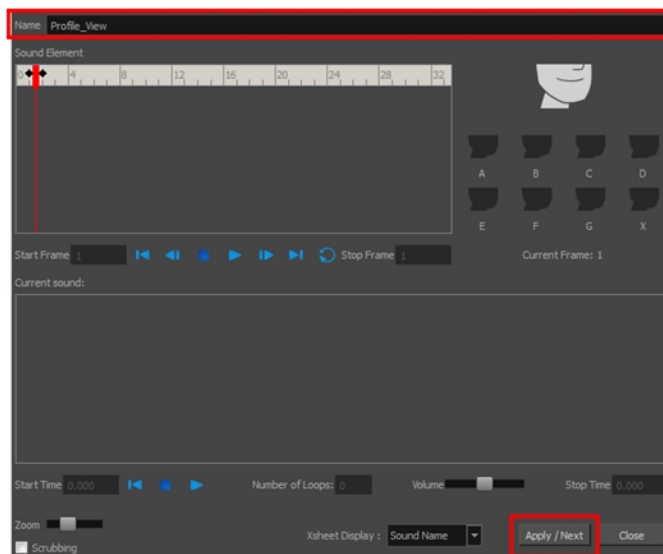

How to add an empty sound layer

1. In the Timeline Layer toolbar, click the Add Layer button.
2. From the drop-down menu, select **Sound**.

An empty (silent) sound layer appears in both the Timeline and Xsheet views.

3. Rename the layers accordingly by double-clicking on the layer name and renaming it in the Sound Element editor. Click **Apply/Next** to accept the change.

1. In the sound file you want to grab sound frames from, click the cell where you want to start the cut and Shift + click on the final cell of the cut. The sample to be cut becomes highlighted.

2. Drag the selection into the empty sound layer below.

4. You can now continue to cut-up and distribute the sound sample between the two layers or carry on to the lip-synching process for each layer and its corresponding facial view.

NOTE: If you need to duplicate your sound layer to keep an unedited copy for safety, select the Duplicate Selected Layers button in the Timeline View toolbar. You must customize the toolbar to display this button because it is not included in this toolbar by default.

About Lip-sync

Adding a lip-sync to your animation is essential to making your characters seem alive. However, it is also a particularly tedious part of the animation process.

To solve this problem, Harmony provides an automatic lip-sync detection feature. This feature analyzes the content of a sound track in your scene and associates each phoneme it detects with one of the mouth shapes in the following mouth chart, which is a standard mouth chart in the animation industry.

NOTE: The letters assigned to these mouth shapes are standard identifiers, they **NOT** correspond to the sound they are meant to produce.

This is an approximation of the English phonemes each mouth shape can be used to represent:

- **A:** m, b, p, h
- **B:** s, d, j, i, k, t
- **C:** e, a
- **D:** A, E
- **E:** o
- **F:** u, oo
- **G:** f, ph
- **X:** Silence, undetermined sound

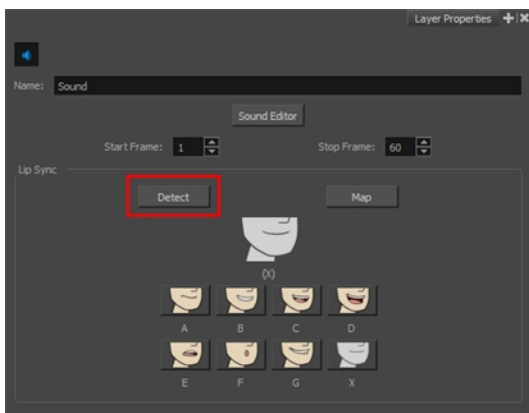

When performing automatic lip-sync detection, Harmony does not create mouth drawings. It simply fills the drawing column of your character's mouth layer with the generated lip-sync, by inserting the letter associated with the right mouth shape into each cell of the column. Therefore, for the automatic lip-sync detection to work, your character's mouth layer should already contain a mouth drawing for each drawing in the mouth chart, and these drawings should be named by their corresponding letter.

Generating a Lip-sync Detection

There are several places where you can perform a lip-sync detection: Layer Properties view, Timeline view, Xsheet view and Sound Element editor.

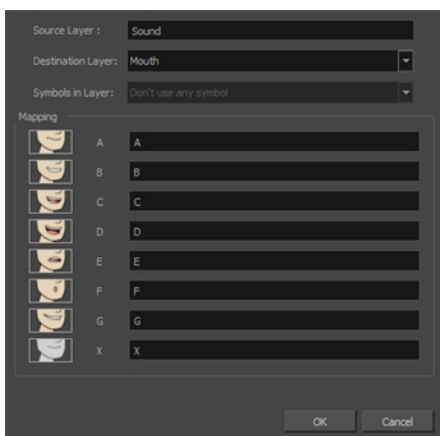

How to generate a sound detection for lip-sync using the Layer Properties view

1. In the Timeline or Xsheet view, select the sound layer.
The options for that layer will appear in the Layer Properties view.
2. In the Layer Properties, click **Detect**.

A progress bar appears while Harmony analyzes the selected sound clips and assigns a lip-sync letter to each sound cell.

3. Click the **Map** button to open the Lip-Sync Mapping dialog box.

4. From the Destination Layer menu, select the layer that contains the mouth positions for the character's voice track.

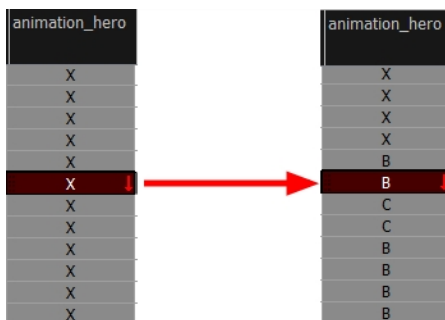

5. If the selected layer contains symbols, you can map the lip-sync using drawings located directly on the layer or use the symbol's frames. In the Symbol Layer field select **Don't Use Any Symbol** if you want to use the drawings or select the desired symbol from the drop-down menu.
6. In the Mapping section, type the drawing name or Symbol frames in the field to the right of the phoneme it represents. If your drawings are already named with the phoneme letters, you do not have to do anything.
7. Click **OK**.
8. In the Playback toolbar, enable the Enable Sound  option.
9. Press the Play  button in the Playback toolbar to see and hear the results in the Camera view

How to generate a sound detection for lip-sync in the Xsheet or Timeline view

1. Do one of the following:
 - In the Xsheet or Timeline view, right-click on the sound layer's cells and select **Lip-Sync > Auto Lip-Sync Detection**.
 - From the top menu, select **Animation > Lip-Sync > Auto Lip-Sync Detection**.

NOTE: To show the mouth chart letters, if they're not already present in the Xsheet view, right-click on the sound column and select **Lip-Sync > Sound Display > Mouth Shapes**.

Harmony analyzes the selected sound clips and assigns a lip-sync letter to each frame. The X markers in the frame are replaced by these designated letters.

How to generate a sound detection for lip-sync using the Sound Element editor

1. Do one of the following:
 - In the Timeline view, double-click on the sound layer.
 - In the Xsheet view, double-click on the sound column header.

The Sound Element editor opens.

2. In Sound Element section, select the waveform for which you want to generate a mouth chart.
3. Right-click on the sound file and select **Auto Lip-Sync Detection**.

A progress bar appears while Harmony analyzes the selected sound clips and assigns a lip-sync letter to each sound cell.

Mapping the Lip-Sync Detection

Harmony can automatically map drawings in an element to the mouth chart you have generated for a sound. This can save time when you are lip-syncing a voice track.

In the Layer Properties view, you can identify each lip drawing of a character. Harmony then automatically labels all of the cells in the character's element with the appropriate name.

How to automatically map lip-sync drawings to a mouth layer

- To open the Lip-Sync Mapping dialog box, do one of the following:
 - In the Layer Properties view, click on the Map button.
 - In the Timeline view, right-click on any cell in the sound sample layer and select **Lip-Sync > Map Lip-Sync**.
 - From the top menu, select **Animation > Lip-Sync > Map Lip-Sync**.

The Lip-Sync Mapping dialog box opens.

- From the Destination Layer menu, select the layer that contains the mouth positions for the character's voice track.

- If the selected layer contains symbols, you can map the lip-sync using drawings located directly on the layer or use the symbol's frames. In the Symbol Layer field select **Don't Use Any Symbol** if you want to use the drawings or select the desired symbol from the drop-down menu.
- In the Mapping section, type the drawing name or Symbol frames in the field to the right of the phoneme it represents. If your drawings are already named with the phoneme letters, you do not have to do anything.

Modifying the Lip-sync Detection

You can change the mouth position assigned to a frame if you think another position is more appropriate.

For example, you may have a character who says nothing for 10 frames between two speeches. Harmony would normally assign an X image for the silent period. However, if you want your character's mouth to hang open in astonishment for these 10 frames, you can change the lip assignment for these frames from an X to an F.

If you modify the sound detection, you will need to remap the lip-sync to your animation—see [Mapping the Lip-Sync Detection](#) on page 1060.

How to change the mouth position assignment of a sound from the Sound Element editor and Layer Properties view

1. Double-click the sound layer name in the Timeline view or the sound column header in the Xsheet view to open the Sound Element editor.
2. In the Sound Element section, drag the frame slider to the frame you want to change the mouth position assignment on.

In the Lip-sync image area, the image on top represents the lip position assigned to the current frame.

1. To change the image assigned to the frame, click on the image of the mouth position you want from below the preview image. The preview image changes to the mouth position image you select. You can perform the same operation in the Layer Properties view.

The position is updated in the Timeline and Xsheet views.

How to change the lip assignment of a sound in the Xsheet or Timeline view

1. Right-click in the cell that contains the mouth position you want to change.
2. From the pop-up menu, select **Lip-Sync > Change Mouth Shape to** and choose the letter that reflects the mouth position you want to use for that sound. You can also select **Animation > Lip-Sync > Change Mouth Shape > *the desired mouth shape*** from the top menu.

NOTE: Note that if you modify the lip-sync detection you must remap the detection to your mouth layer.

Manual Lip-syncing

You can manually create the lip-syncing for your scene by selecting which mouth drawing should be exposed at each frame of your character's dialogue. For this process, you will be using the Sound Scrubbing functionality, which plays the part of your sound track at the current frame whenever you move your Timeline cursor, allowing you to identify which phonemes you should match your character's mouth to. You will also be using drawing substitution to change which mouth drawing is exposed at every frame.

How to animate lip-sync using the Timeline view

1. In the Playback toolbar, enable the **Sound Scrubbing**  button.
2. In the Timeline view, drag the red playhead along the sound layer waveform.
3. When you reach a frame where a mouth position should go, for example, an open mouth with rounded lips for an "oh" sound, click on that frame on your mouth shapes layer.
4. In the Parameters section, staying on your mouth shapes layer, place your cursor on top of the drawing name (often a letter) until it changes to the swapping  pointer.
5. Pull the cursor to see the list of mouth shape names and choose the one you want. The current drawing automatically changes to the new selection.

How to animate lip-sync using the Library view

1. In the Playback toolbar, click the Sound Scrubbing  button.
2. In the Timeline view, drag the red playhead along the waveform of your sound layer.
3. When you reach a frame where a mouth position should go, for example, an open mouth with rounded lips for an "oh" sound, click on that frame on your mouth shapes layer.
4. In the Drawing Substitution window of the Library view, drag the slider to choose a mouth shape. The current drawing is swapped for the one in the preview window.

Chapter 19: Effects

T-HFND-010-001

When creating a scene, rigging a character or once your animation is finished, you can add effects such as blurs, glows, shadows, colour filters and transparency filters and to enhance your project's quality. Effects change the way layers or groups of layers are rendered in your scene.

Effects are special types of layers that you can add to your scene's structure. For an effect layer to work, it must be connected to a drawing or a group. Effects only alter the drawing or group they are connected to, which gives you flexibility in deciding precisely which parts of your scene is affected.

Some effects need to be linked to another layer referred to as the *matte* layer, which is used to define the area they should affect. The most basic example of this is the Cutter effect. Alone, a cutter effect does not have any effect on your drawing. Once combined with a matte layer, the Cutter effect cuts the shape of the matte out of the drawing.

A matte layer is simply a drawing layer that is connected to an effect as its matte. The effect takes the shape of the drawing in the matte layer, ignoring its colours and details.

In the Timeline view, an effect must be rigged as the child of the drawing layer or group it is meant to affect. If the effect requires a matte, it will have a Matte parameter, on which you can drag and drop the layer you wish to use as the effect's matte layer.

Once your effect is connected, you can adjust its parameters using the Layer Properties view. If desired, you can even animate the parameters of your effect by converting their values to functions.

Adding Effect

T-HFND-010-004

In Harmony, you can add effects through the Timeline view, connecting them to your drawing layers and then adjusting the parameters until you achieve the look you want.

How to add effects in the Timeline view

1. In the Timeline view, select the layer on which you want to add an effect.
2. Do one of the following:
 - From the top menu, select **Insert > Effects > effect**.
 - In the Layers toolbar, click the Add Layers **+** button and select **Effects > effect**.
 - From the Timeline menu, select **Insert > Effects > effect**.

The effect appears in the Timeline view.

3. In the Camera view, click the Render View button to see the scene's rendered current frame and effect. Note that most effects cannot be played back in real time. You need to use the Render and Play option in the Playback toolbar.

NOTE: By default, your background will appear pitch black. To remedy this, you can add a Colour Card layer at the bottom of your layers list, and tweak its colour in the Layer Properties view.

4. In the Timeline view, double-click on the effect layer to open the Layer Properties window. You can also select the effect layer and see its properties in the Layer Properties view.

The Layer Properties view opens, displaying the parameters available for the selected effect.

5. In the Layer Properties view, adjust the effect's parameters as needed. Each time you make a change, the Camera view will need to refresh the render, which may cause a little delay before you can observe its effect.
6. To play back your scene with the final effects, in the Playback toolbar, click the Render and Play  button.

NOTE: Once you have set the parameters for the effect, you can store it in the Library view as a template, so you can quickly reuse it without resetting the parameters again—see *Templates* in Chapter 7: Library of the Cut-out Animation Guide.

Connecting Effects

T-HFND-010-006

You can connect layers to effects that have a single input or multiple input, such as effects using masks.

How to connect an effect in the Timeline view

1. In the Timeline view, select the effect you want to connect to the drawing layer.
2. Drag the effect and drop it onto the drawing layer.

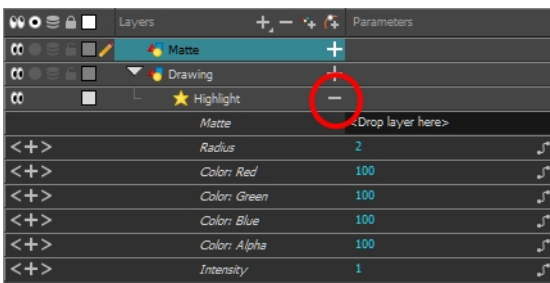

How to connect effects with more than one port

1. Select a drawing layer.
2. Click the Add Layers **+** button and select **Effects > Highlight**.

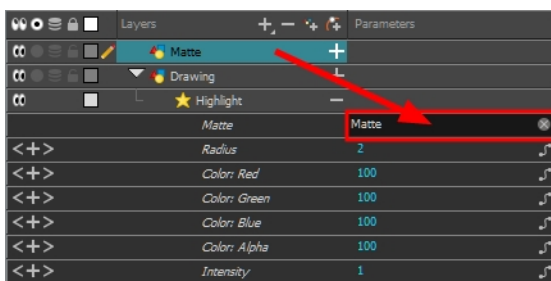

The Highlight effect is parented to the selected layer.

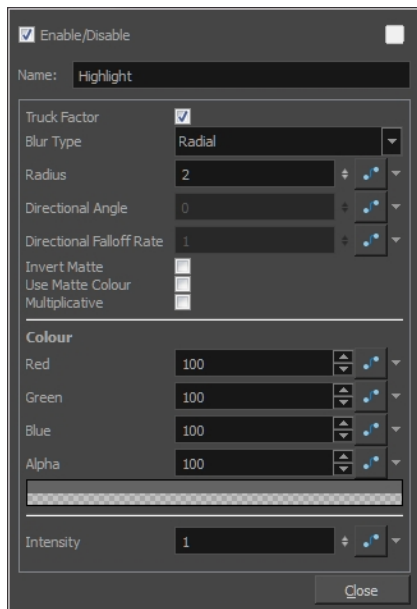

3. In the Drawing or Camera view, create a drawing on a new layer that will act as the matte.
4. In the Timeline view, click the Collapse/Expand **+** button on the effect layer.

5. Drag and drop the matte layer beside the Matte field.

- Connect the Matte drawing to the Matte port of the Highlight node.
6. Display the effect properties and adjust them until you achieve the desired effect.

About Effects Preview

T-HFND-010-010

Most effects must be rendered so you can preview them properly. Some effects can be displayed in the OpenGL view, but most of them must be rendered and previewed in the Render Mode of the Camera view.

Once you preview your effect, you may want to adjust it. By default, as soon as you modify a parameter, Harmony will recalculate the preview image. If your scene is heavy and you do not want the preview rendered automatically, deselect the Auto-Render option and do the preview update manually.

You cannot play back your animation in Render mode. You must perform a render or a preview render to see your animation with the final effects. Effects must be calculated before they can be viewed in real time.

To make your previews calculate faster, you may want to render them at a smaller resolution. You can use the Preview Resolution command so you will not have to modify the resolution of your scene every time you make a check preview.

Previewing Effects in Render Mode

T-HFND-010-011

You can preview a single final frames with all effects calculated in the Camera view when you enable the Render mode. You cannot playback your animation in Render mode. You can also disable the auto-render option when adjusting several effect parameters to avoid slowing down your computer.

How to preview effects in Render mode

1. In the Camera view status bar, click the Render Mode  button.

In the bottom-right corner of the Camera view, the progress bar indicates the status of the render. Depending on the size of the frame to render, it may take several seconds.

How to disable the Auto-Render option

1. In the Camera view status bar, click the Auto-Render  button. In the top menu, you can enable and disable **Scene > Render > Auto-Render**.

Once the Auto-Render option is disabled, you must request the preview update by clicking the Auto-Render  button.

How to manually update the rendering preview

1. In the Camera view status bar, click the Render  button.

Playing Back Effects

T-HFND-010-012

To playback your effects, you need to do a temporary render.

How to play back effects

1. In the Playback toolbar, click the Render and Play  button.

The Play node opens and loads the frames.

2. Once the frames are loaded, click the Play  button in the Play window.
3. Select **Scene > Render > Cancel Preview Render** to cancel the rendering.

NOTE: While previewing effects, you can press the Spacebar to stop and start playback.

Changing the Preview Resolution

The Preview Resolution command allows you to quickly get a preview at three-quarter, half, one-third, or one-quarter of the scene resolution. You can even customize the preview resolution size.

How to use the Preview Resolution command

1. From the top menu, select **View > Preview Resolution** and one of the following:
 - ▶ Same as Scene Resolution
 - ▶ 3/4 of Scene Resolution
 - ▶ 1/2 of Scene Resolution
 - ▶ 1/3 of Scene Resolution
 - ▶ 1/4 of Scene Resolution
 - ▶ Custom

If you selected the Custom option, the Custom Preview Resolution dialog box opens.

2. In the dialog box, select a resolution from the presets or type a new X-Y value.
3. Click **OK**.
4. Preview your effects animation.

Animating an Effect

In some cases, you may want to have the intensity, color, or another parameter of an effect animated. For example, you may want an object to fade in or out, which would require making its transparency level animated so that it increases or decreases as your scene goes. You can animate an effect's parameters by creating a function curve for its parameter. You can then add keyframes to the function and set them to different values, hence making your effect's parameter change value as your scene plays out. To do this, you will need to use the Layer Properties view.

How to animate an effect

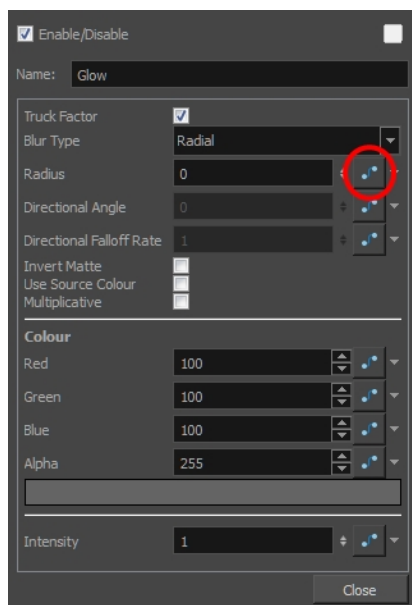

1. In the Timeline view, select a layer and add an effect to it by doing one of the following:

- Click the Add Layer **+** button and select **Effects > desired effect**.
- Right-click and select **Insert > Effects > desired effect**.
- From the top menu, select **Insert > Effects > desired effect**.

2. Create the function curve by doing one of the following:

- Double-click on the effect layer to display the effect properties. Click the Function  button of the parameter you want to animate and create a function curve.

- In the Timeline view, expand the effect layer's parameters by clicking the Collapse/Expand **+** button. Then click the Function  button of the parameter you want to animate and create a function curve.

3. In the Timeline view, go to the frame on which you want to start animating the effect.
4. In the Timeline toolbar, click the Add Keyframe  button.
5. In the Value field of the parameter you want to animate, enter the keyframe value. If your keyframes are stop-motion keyframes, in the Timeline view, select the new keyframes. Right-click and select **Set Motion Keyframe**.

6. Repeat these steps until your effect's animation is complete.

NOTE: Refer to [About Effects Preview on page 1071](#) to learn how to preview animated effects.

About Advanced Node Usage

Some nodes only require to be connected to a drawing node, others require additional operations and connections. In this section you can see how to use some of the most common effects. You can also refer to the Nodes section in the Reference guide to learn more about each node—see the Reference guide .

Using the Shadow Node	1078
Using the Cutter Node	1080
Using the Highlight Node	1081
Using the Tone Node	1082
Overriding a Colour	1083

Using the Shadow Node

The Shadow effect uses the shape of the drawing connected to create the shadow behind another element and can blur the edges to create a softer effect. You can control the type and amount of blur, as well as the colour of the shadow.

To add a shadow stretched out on the ground, simply add a Quadmap node to flip, stretch and skew the matte. Attach the entire effect to the same trajectory as your drawing layer and watch the shadow move along with your character—see the Reference guide .

How to use the Shadow effect

1. Select a drawing layer.
2. Click the Add Layers **+** button and select **Effects > Shadow**.

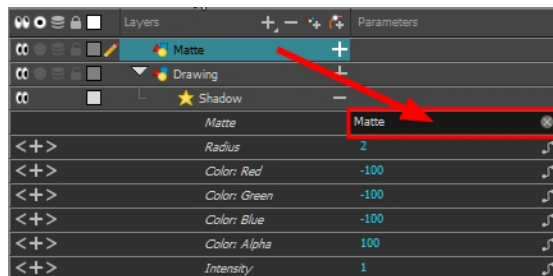

The Shadow effect is parented to the selected layer.

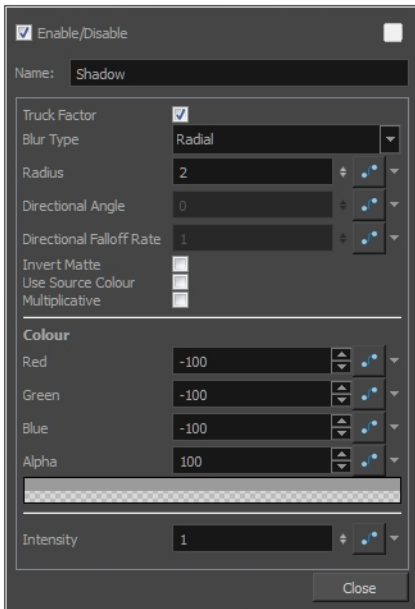

1. In the Drawing or Camera view, create a drawing on a new layer that will act as the matte.
2. In the Timeline view, click the Collapse/Expand **+** button on the effect layer.

3. Drag and drop the matte layer beside the Matte field.

3. Display the **Shadow** properties and adjust the properties to control the type and amount of blur and the colour of the tone effect.

Using the Cutter Node

You can use the Cutter node to cut out parts of a layer. You can also use it to only show certain parts of a layer by enabling its Inverted parameter.

How to use the Cutter effect

1. Select a drawing layer.
2. Click the Add Layers **+** button and select **Effects > Cutter**.

The Cutter effect is created as a child of the selected layer.

3. In the Timeline view, create a new layer, which will be used as your Cutter effect's Matte layer.
4. In your new Matte layer, draw the shape that you want to cut out from your drawing layer.
5. In the Timeline view, click the Collapse/Expand **+** button on the effect layer to display its Matte parameter.

6. Drag and drop your matte layer next to your Cutter layer's Matte field, under the Parameters column.

7. If you want to invert the Cutter's effect, double-click on your Cutter layer to open its Layer Properties dialog, then enable the Inverted option.

Using the Highlight Node

You can use the Highlight node to create light zones of your artwork. Anything outside of the given artwork will be automatically clipped.

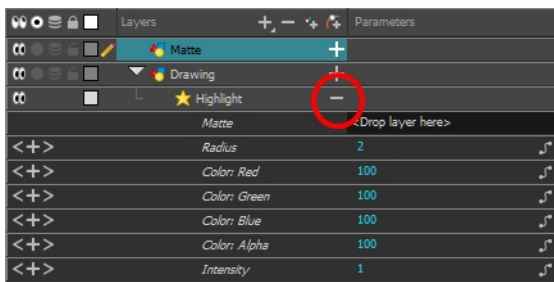

How to use the Highlight effect

1. Select a drawing layer.
2. Click the Add Layers **+** button and select **Effects > Highlight**.

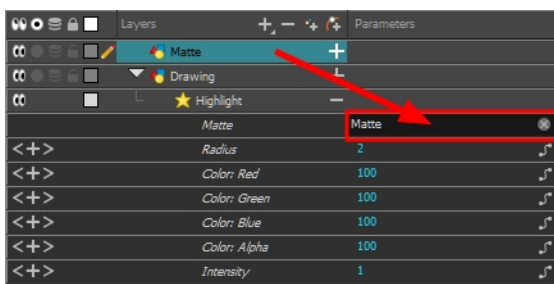

The Highlight effect is parented to the selected layer.

3. In the Drawing or Camera view, create a drawing on a new layer that will act as the matte.
4. In the Timeline view, click the Collapse/Expand **+** button on the effect layer.

5. Drag and drop the matte layer beside the Matte field.

1. Display the Highlight properties and adjust the properties to control the type and amount of blur and the colour of the highlight effect—see the Reference guide .

Using the Tone Node

You can use the Tone node to create shadow zones of your artwork. Anything outside of the given artwork will be automatically clipped.

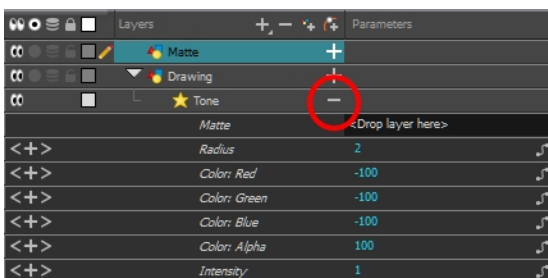

How to use the Tone effect

1. Select a drawing layer.
2. Click the Add Layers **+** button and select **Effects > Tone**.

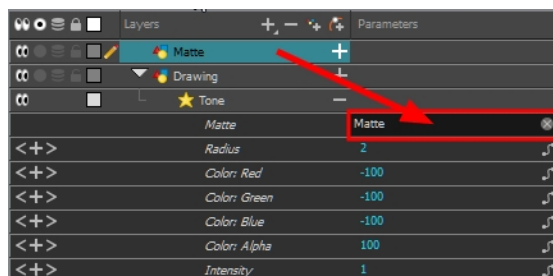

The Tone effect is parented to the selected layer.

3. In the Drawing or Camera view, create a drawing on a new layer that will act as the matte.
4. In the Timeline view, click the Collapse/Expand **+** button on the effect layer.

5. Drag and drop the matte layer beside the Matte field.

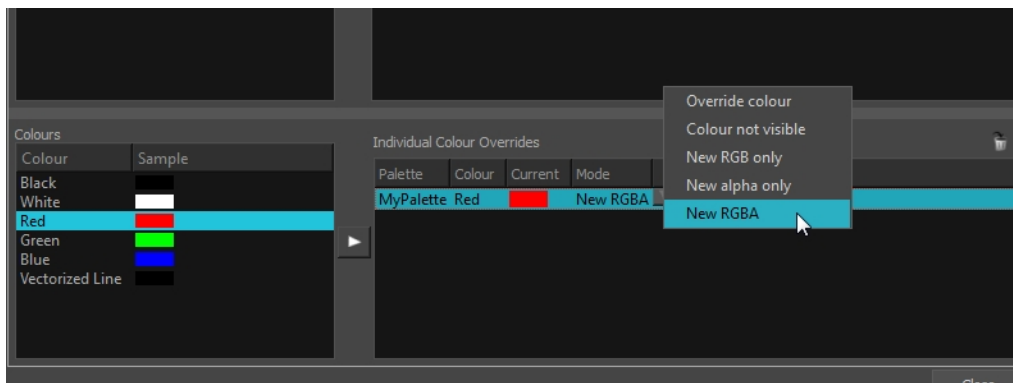

6. Display the Tone properties and adjust the properties to control the type and amount of blur and the colour of the tone effect—see the Reference guide .

Overriding a Colour

With the Colour-Override node, you can change the colour of some swatches.

How to override colours

1. From the Colours section, select the colour swatch to modify and move it to the Individual Colour Overrides section. Several options are available to modify your colours.

2. Once the swatch appears in the Colour-Overrides section, click the drop-down arrow and select one of the following options from the Mode menu:
 - **Override colour:** When selecting a colour swatch from a clone palette (not set as the current palette), use this option to override the current colour and use the swatch from the clone palette over the corresponding one in the current palette.
 - **Colour Not Visible:** Renders the selected colour invisible in the Camera view.
 - **New RGB Only:** Overrides the colour swatch RGB value while maintaining its original alpha value. You can select a new colour by clicking on the colour swatch and choosing a new colour from the Colour Picker window.
 - **New Alpha Only:** Overrides the swatch's alpha channel while maintaining its original RGB values. You can select a new alpha value by clicking on the colour swatch and choosing an alpha value from the Colour Picker window.
 - **New RGBA:** Overrides the swatch's colour and alpha values. You can select a new colour by clicking on the colour swatch and choosing an alpha value from the Colour Picker window.

Chapter 20: Export

Now that you've finished your animation, it's time to render your movie. Depending on whether you plan to further edit your movie using a third party software, composite the movie in a larger body of work or put it up directly on the web, Harmony supports several formats for all your rendering needs.

The render resolution for the various editions of Harmony are:

- Harmony Essentials: 2K (2048x1556)
- Harmony Advanced: 4K (4096x3112)
- Harmony Premium: Unlimited

Exporting QuickTime Movies

T-HFND-010-013

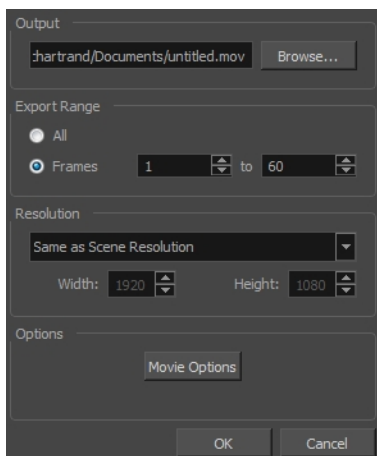

If you need to create a video file, you can export your scene as a QuickTime movie.

By default, Harmony will export your entire scene in your scene's actual resolution. You can also choose to export only a specific frame range in your scene, or to export in a smaller resolution, which can be useful if you need to save on time or disk space. If you have specific requirements for the quality of your exported video files, you also have access to the codecs and compression settings made available by QuickTime's interface.

How to export a QuickTime Movie

1. From the top menu, select **File > Export > Movie**.

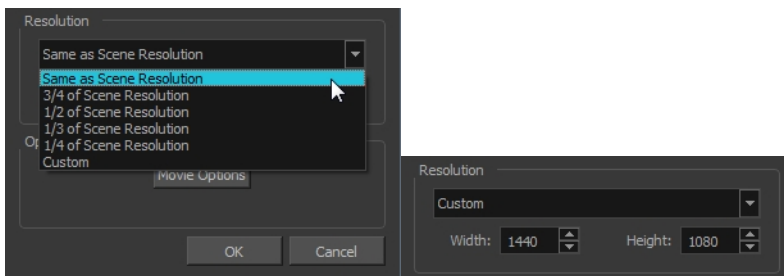

The Export to QuickTime Movie dialog box opens.

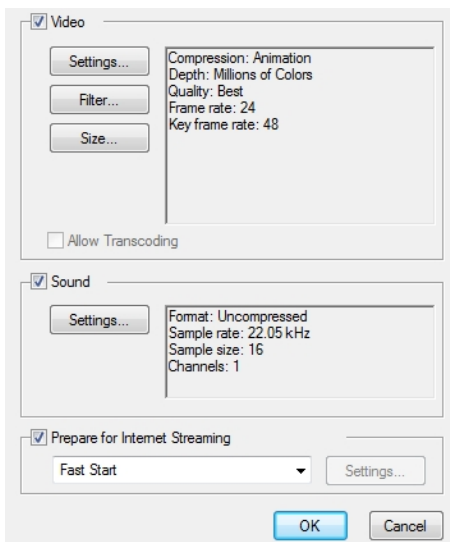

2. Click **Browse** and select a folder in which to save your movie and give it a file name for the export.
3. Click **OK**.
4. From the Export Range section, decide whether you want to export the entire scene (All) or a specific frame range. If you decide on the latter, enter the frame range.

5. In the Resolution section, select one of the following from the menu:
 - A preferred resolution ratio.
 - **Custom**: Enables the Width and Height fields so you can enter a specific size.

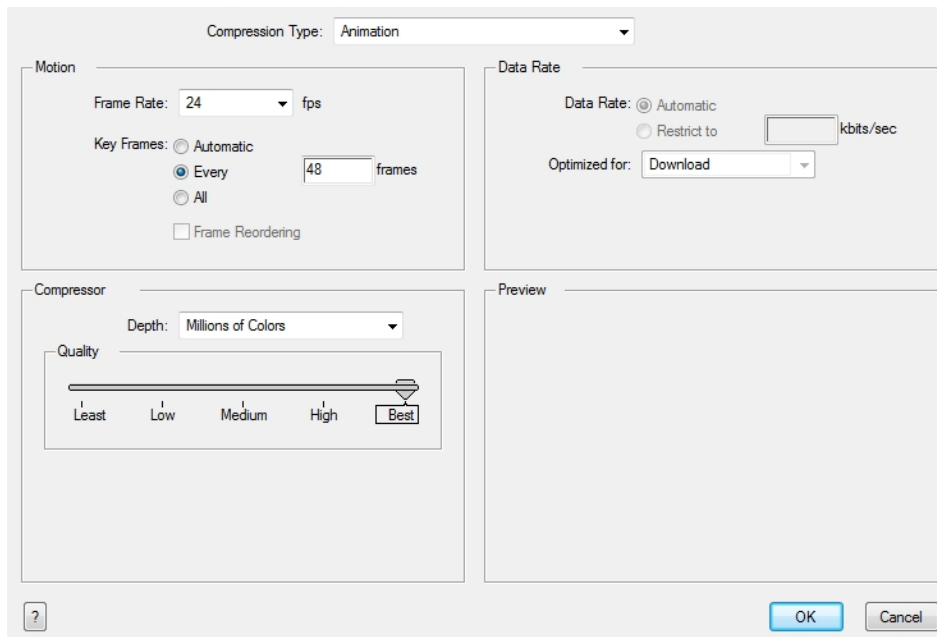

6. In the Options section, click **Movie Options**.

Parameter	Description
Video	Enables the customization of the video settings, filters and size.
	Settings: Opens the Standard Video Compression Settings dialog box.
	Filter: Opens the Choose Video Filter dialog box, where you can select from a range of filters to apply to your video export.
	Size: Opens the Export Size Settings dialog box. The size settings are overridden by the Harmony's scene settings.
Sound	Enables the customization of the sound settings.
	Settings: Opens the Sound Settings dialog box (see below).
Prepare for Internet Streaming	Enables the customization of the Internet streaming options.

7. In the Video section, click **Settings**.

The Standard Video Compression Settings dialog box opens.

8. From the Compression Type menu, select a codec. The availability of certain compression settings depends on the Compression Type selected. For example, Animation is the default compression type and as a result the Data Rate option is greyed out.

NOTE: If you want to render a QuickTime movie with lossless compression and transparency, you can use the Animation video codec with the colour depth set to Millions of Colours +.

9. In the Motion section, choose a **Frame Rate** from the list.

By default, it is set to match the frames-per-second (fps) of your Harmony project. If you choose a lower frame rate, your export playback will be faster than your actual project. The reverse is also true for a higher frame rate.

10. If you want keyframes inserted, select the **Every** option and set the number per frame.

This is the option is recommended by QuickTime. For further details, refer to the QuickTime documentation.

11. In the Quality section, use the slider to choose a quality setting. Remember that the better the quality of the export, the larger the file.

12. From the Data Rate section, either choose to allow the program to automatically select the most optimal bit rate, or enter a Restricted rate to save space and allow for faster downloading at a cost to the quality of the export.

13. In the same section, from the Optimized For menu, select the intended viewing method for the export.
14. Click **OK**.
15. From the Movie Settings dialog box, click **Sound Settings**.

The Sound Settings dialog box opens.

16. From the **Compressor** menu, select a compression type. The default setting is **None**. This exports your audio as is without performing any lossy compression or conversion, preserving its fidelity. Other compressors can be used if you need your movie's audio track to be exported in a specific format, or if disk space or download speed is critical, but they may impact the quality of your movie's soundtrack negatively.
17. From the **Rate** menu, select a rate. It is best to export your audio at a rate that matches the rate of your original sound files. For example, if your file has an audio sample rate of 48 kHz and you choose a conversion rate of 22.05 kHz, the sound will play at the same speed, but higher frequencies will be missing, making it sound muffled. For reference, the standard sound quality is **44.1 kHz** for films, and **48 kHz** for DVD. Lower rates are liable to impact the quality of your movie's soundtrack negatively, but they can be useful if disk space or download speed is critical.
18. Select the **Size** of your audio's encoding. Also known as *Bit Depth*, this determines the amount of precision used to record each wavelength in the soundtrack. The standard size is **16-bit**. If you choose **8-bit**, the amount of disk space your sound track requires is halved, but the audio will sound muffled.
19. Select whether to **Use** the **Mono** or **Stereo** channel mode. Stereo sound has a separate sound track for the left and the right speakers, allowing to make the origin of each sound realistically match the origin of their corresponding action. If you choose Mono, your sound track may use less disk space, but both the left and right channels will be merged into a single track.
20. Click **OK**.
21. In the Export to QuickTime Movie dialog box, click **OK**.

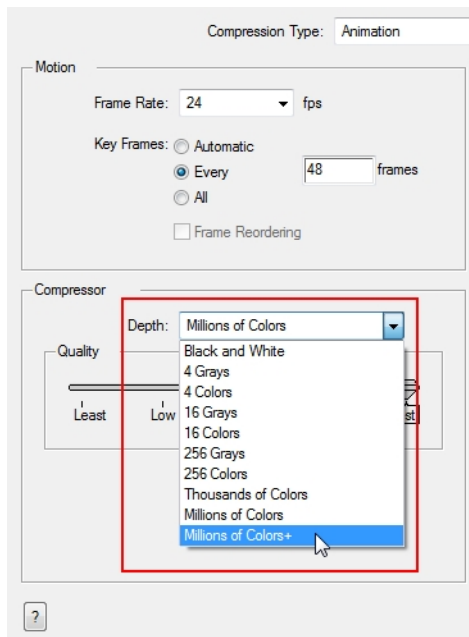

A progress bar appears.

22. Browse to the location on your computer where you saved your QuickTime video and double-click on it to view the export.

How to set the depth to Millions of Colours + to export a QuickTime movie with transparency

- In the Standard Video Compression Settings dialog box, select **Millions of Colors+** from the Depth menu.

Exporting SWF Movies

Exports a Flash movie file.

The SWF export supports some bitmap effects (which can be previewed in Render View mode) and SWF Blend Modes (vector effects which can be previewed in OpenGL View mode).

The following are also supported:

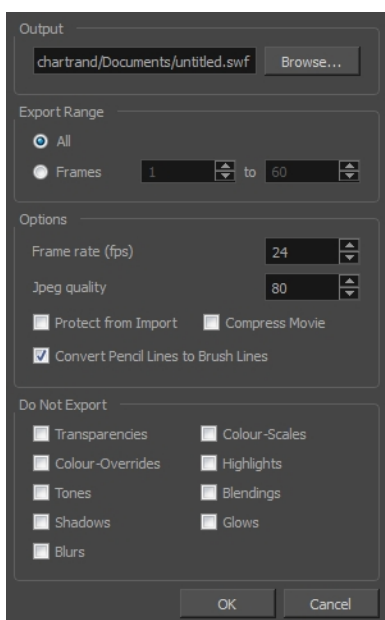

- Pencil line thickness: They are converted to brush strokes in the .swf file.
- Auto Patch node for creating joint patches.

If you have not already done so, you should preview the .swf by using the SWF preview  button to see what the two types of effects look like when blended together. Once you are satisfied with the results, go ahead and export your movie.

How to export a .swf movie

1. From the top menu, select **File > Export > SWF**.

The Export to Flash Movie (.swf) dialog box opens.

2. Click **Browse** and select a file name and destination path for your movie.
3. In the Export Range section, select one of the following options:
 - ▶ **All**: To export all the frames of your movie.
 - ▶ **Frames**: To export a frame range. Enter the frame range in the fields.

4. In the Options section, enter a Frame rate (fps). By default, it will be set to match the fps of your Harmony project. If you choose a lower frame rate, your export playback will be faster than your actual project. The reverse is also true for a higher frame rate.
5. In the same section, select the JPEG quality:
 - 100 = Full quality
 - 50 = Average quality at about 1/5th of the size.
 - 25 = Medium quality where loss of high image resolution starts to occur.
 - 10 = Low quality where “macro-blocking” or large pixelation become obvious.
 - 1 = Lowest quality where there is extreme loss of colour and detail and the image becomes nearly unrecognizable.
6. To prevent your movie from being imported into another application, select the **Protect from Import** option.
7. For a lighter format, select the **Compress Movie** option. The movie may lose some quality, but the file will be lighter.
8. To retain the thickness of pencil lines, select the **Convert Pencil Lines to Brush Lines** option.
9. In the Do Not Export section, select the effects you do **NOT** want to be rendered in the SWF movie.

Note that certain Harmony effects are not listed in this section as they are not compatible and therefore not available for SWF export. These effects will not appear in the SWF render.
10. Click **OK**.
11. Browse to the location on your computer where you saved your Flash Movie and double-click on it to view the export.

Exporting Image Sequences

In Harmony, you can export a scene as a bitmap image sequence. If there is sound in your scene, it will not be exported with the images.

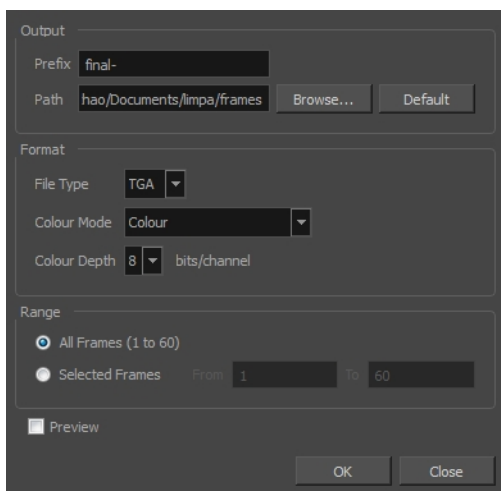

If you want to export images with transparency, you need to select the file type that supports this option, such as .tga, .psd or .png. Harmony supports 16 bits per channel RGB and RGBA .png files. The Colour Mode menu changes according to the File Type selected. For example, selecting .tif will result in only having "Colour" as a Colour Mode option, whereas .png will have "Colour" and "Colour with Transparency".

To export your images in batch processing (render farm), refer to [Batch Rendering on page 1097](#).

How to render an image sequence

1. From the top menu, select **File > Export > Images** or press Ctrl + Shift + Y (Windows/Linux) or ⌘ + Shift + Y (Mac OS X).

The Export Images dialog box opens.

2. In the Output section, choose a prefix. The prefix is the file name. Each image in the sequence will have this name, plus a sequence number and file format extension. For example: final-0001.jpg.
3. Click **Browse** and specify the location in which your movie will be saved. The default location is the file directory's frames folder.
4. In the Format section, choose the File Type, Colour Mode and Colour Depth from their respective menus.
5. In the Range section, select the Frame Range to render.
 - **All Frames:** Exports export the entire scene.
 - **Selected Frames:** Lets you specify the first and last frame of the frame range to export.
6. Select the Preview option to see the images being rendered.
7. Click **OK**.

If you selected the Preview option, a generic player opens so you can watch the image sequence strung together as a video. The image sequence is now available in the scene's frames directory. You should be able to preview each frame as an individual image.

How to render an image sequence with transparency

1. Open the Export Images dialog box.
2. In the Format section, select **Colour with Transparency** from the Colour Mode menu.

Exporting OpenGL Frames

You can export the OpenGL frames (fast display mode) if you need a quick render for your scene. Heavier scenes containing 3D, multiple effects and camera moves can be fairly long to export.

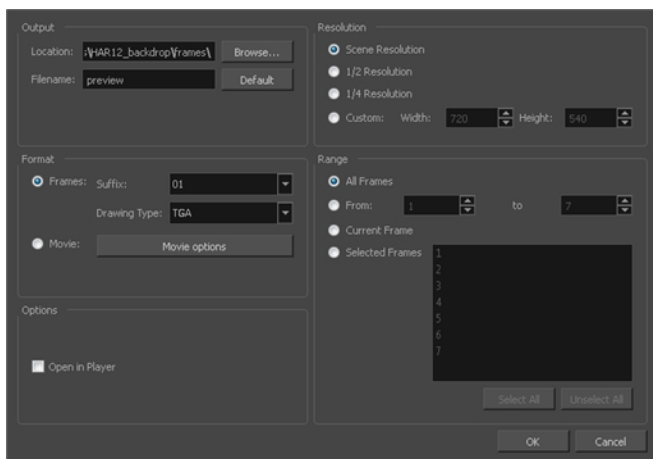

Use the Export OpenGL Frames dialog box to select the frames you want to render from the OpenGL Camera view, then save the rendered frames as image files or as a QuickTime movie.

Frames saved from OpenGL view have neither antialiasing nor special effects. To render final frames with effects, export as images or a movie.

How to export OpenGL Frames

1. From the top menu, select **File > Export > OpenGL Frames**.

The Export OpenGL Frames dialog box opens.

2. In the Output section, click **Browse** and select a folder for the frames.
3. In the Filename field, enter a name (prefix) for the frames or revert to the default name by clicking **Default**.
4. In the Format section, decide if you want to export individual image frames or a movie.
 - **Suffix:** Lets you select the desired suffix. If you intend to render only a few frames, use 1 or 01, whereas if you intend to render 1000 frames, you can select 0001.
 - **Drawing Type:** Lets you select the file type to render, such as .tga or .sgi.
5. Click **Movie Options** to customize the Audio and Video settings for the *.mov export—see [Exporting Quick-Time Movies](#) on page 1086.
6. From the Resolution section, select a resolution for export. If you are running some quick tests, then you might want to reduce the resolution to save time and space. You also have the option to set a Custom width and height to produce smaller or larger frames.
7. In the Range section, decide whether you want to render all your frames, a range of frames, the current frame or selected frames.
8. In the Options section, select the **Open in Player** option to view the rendered frames.

9. Click **OK**.

Batch Rendering

Harmony Server has the possibility to render your scene locally or send it to a render farm so other computers can render your scenes while you continue working on your station. This option is not available with Harmony Stand Alone.

There are two approaches to rendering a scene in Harmony Server:

- **Local Rendering** is done directly by your machine in your Harmony session. Hence, it uses your machine's resources and will prevent you from working on the scene until the render is done. You will see the render progress in real time and will be able to preview the results right after it's finished.
- **Batch Rendering** is done by sending a scene to the server's render queue so it can be processed by the render farm. This allows you to keep working on your scene while the render is being done. The rendering progress can be monitored in Control Center and, when finished, the results can be previewed in Play.

Batch rendering is a background process divided over several machines or a render farm. Sending your scene to batch render will share the rendering load with other machines in the render farm and lessen the amount of work required by your computer.

NOTE: Refer to the Harmony Server Guide and Installation Guide to learn how to send scenes to batch render and check the status of the Render queue.

How to send a scene to the batch rendering queue

1. Save all the contents of your scene, all drawings, colour palettes and the palette list.
2. Select **File > Save** or press Ctrl + S (Windows/Linux) or ⌘ + S (Mac OS X).
3. From the top menu, select **File > Export > Export Images** or press Ctrl + Shift + Y (Windows/Linux) or ⌘ + Shift + Y (Mac OS X).

If the system administrator did not complete the resolution configuration tasks, a warning message will open. This message notifies you that the resolution.conf file was not properly inserted in the configuration folder.

4. Click **OK** to continue. You will still be able to render your scene.

The Export Images dialog box opens.

5. In the **File Type** list, select the desired file type for the exported images.
6. In the **Colour Mode** list, select an option to export your images: **Colour**, **Colour with Transparency**, or **Greyscale**.
7. In the **Colour Depth** menu, select the number of bits per channel for the exported images. Most format only support 8 bits, but some support 16 bits.
8. In the Range section, select the frames you want to render:
 - **All Frames**: Sends all the frames in the scene to be rendered.
 - **Selected Frames**: Sends the specified range of frames to be rendered.
9. Select the **Batch Composite** option.
 - Select the **Chunk** option if you want to split the render jobs into several smaller render jobs. This can be useful for example if you want your scene to be rendered by several machines in the render farm at the same time. Note that this only affects Frame renders. If the render includes a movie file, the movie will still be exported as a single file once all the frames have been rendered.
 - Enter the number of frames for each chunk in the **Size (Frames)** field. For example, if your scene is 100 frames long and you enter a value of 20, there would be five entries in the queue of 20 frames each.

- Select from which camera the scene should be rendered. By default, scenes only have one Camera, but more can be added in the Node View, and each of them can be positioned and animated independently.

10. Click **OK** to start the rendering process.

A confirmation dialog box opens to inform you that the frames have been sent to the Render queue.

If the selected frames were already sent to the Render queue, but were not yet rendered, dialog box opens to inform you that these frames were already in the queue, but that they have been updated with the latest rendering request.

You can also send scenes to batch rendering and check the status of the rendering queue from Control Center.
